To live in peace with each other

NEC

Integrated Systems for Television and Radio Broadcasting

From compact transistorized studio camera chains to VHF and UHF transmitters and antennas, NEC offers a completely integrated line of modern television broadcasting equipment. At present, NEC television systems are used in over 60% of Japan's 105 stations, and by stations in Australia, Cambodia, Indonesia, the Philippines, Taiwan and other parts of the world. For radio broadcasters in Japan and overseas, NEC provides complete systems with transmitter powers ranging from 100 watts to 200 kilowatts. For example, NEC has also supplied Spain with a complete system of 200-kilowatt MW broadcasting equipment using two 100-kilowatt medium transmitters operating in parallel. NEC equipment for both services has been designed to meet the highest international broadcast standards of signal quality, stability, and reliability. All NEC equipment is designed for easy access, simple maintenance and minimum power consumption. If you are planning a new installation or expanding an existing one, it will be worth your while to investigate a modern NEC integrated broadcast system.

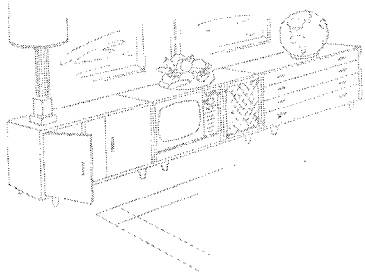
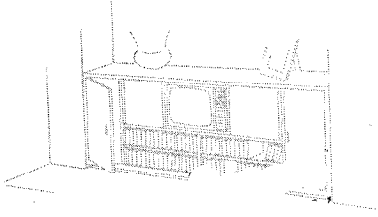
Andrea *Satellite* **THE MOST TROUBLE-FREE...**

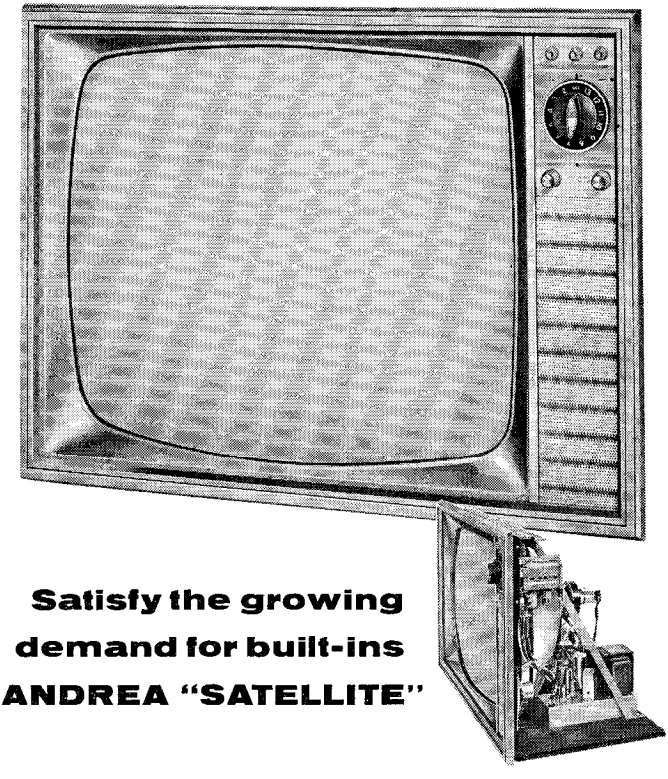
EASIEST TO INSTALL CUSTOM TELEVISION CHASSIS

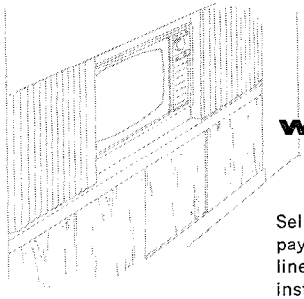




NEW 23-INCH, 110°, BONDED ALUMINIZED PICTURE TUBE

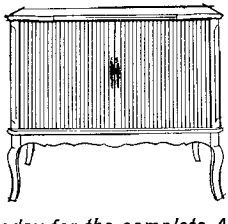
- HAND WIRED HORIZONTAL CHASIS
- TURRET TYPE TUNER
- HEAVY-DUTY POWER TRANSFORMER
- CLIMATE-SEALED COMPONENTS
- 26-TUBE PERFORMANCE
- HI-FI PICTURE AND SOUND
- 110/220 VOLTS, 50/60 CYCLES





Satisfy the growing demand for built-ins with ANDREA "SATELLITE"

Sell the revolutionary new Andrea Satellite and you sell the custom quality chassis that pays off in more satisfied customers, fewer servicing headaches. Slim, smart, streamlined, the Satellite fits into bookcases, room dividers, cabinets—spaces where other installations could not be made. Once installed, it shows only its 23" screen and handsome satin-gold wood frame and control panel, blending smartly with any decor. And Satellite is easiest of all to custom install. Specially made to meet the transmitting standards of your own market, and featuring Universal power transformer, 110-150-200-220 volts, 50/60 cycles; specially impregnated parts and components as protection against damaging moisture; front mounted, self-contained oval speaker, and plug in arrangements for additional speakers.



Andrea also offers you a complete TV line featuring finest furniture cabinetry and precision quality. Pictured here—The Fontainebleau—an authentic masterpiece in French provincial decor. Exquisite sliding tambour doors, 4 rich hardwood finishes.

SHURE

440SL HAM MICROPHONE

- Sharp Cutoff Below 300 and Above 3000 cps – Minimizes Splatter, Reduces Unwanted Sideband.
- Elimination of resonant peaks permits higher average power – more audio punch.
- Shaped frequency response–Superb Intelligibility–Naturalness of voice.
- Trouble-Free Controlled-Magnetic Design – Hi-Output – 52.5 db – Extraordinarily Rugged – No humidity problems.

MODEL 440SL
Complete with Grip-to-Talk Switch, Desk Stand, 7 ft. Two-Conductor Shielded Cable. Cable Connector equivalent to Amphenol MC3M plug. Will operate VOX and Grip-to-Talk.

MODEL 440
Low Cost, but with the same outstanding performance characteristics as 440SL. 7 ft. single conductor (shielded), less stand, switch, connector.

A87K Modification Kit for use with 440SL Microphone to obtain optimum flexibility between either VOX or push-to-talk operation.

A PREFACE BY THE EDITOR

This is the seventeenth edition of the World Radio Television Handbook in which we have attached importance to giving as much practical information as possible to short wave listeners in the hope that this will make it easier and quicker for them to pick up the broadcasts of the various countries and to identify the stations.

● We have three wishes to advance: the one is to help us by making WRTH as well-known as possible in all circles interested in radio and television in general and in short wave listening in particular; the other is to receive your criticism and wishes in regard to the contents of the 1963 edition.

● To broadcasting and television stations we direct an earnest appeal to send us regularly all corrections and particulars of extensions, which will then, be passed on for the benefit of listeners all over the world.

● This edition will be as well received as have been its predecessors and that it will serve its purpose: to help peoples all over the world to learn each other's cultures and modes of life, thus promoting understanding and good-will between them.

Thanks are due to all those who have assisted in various ways in the preparation of this edition – to all broadcasting and television organisations irrespective of politics, race or religion – to radio clubs and contributors in many countries all over the world, and to our many faithful advertisers.

O. LUND-JOHANSEN

TRANSISTORIZED PORTABLES OF REAL QUALITY

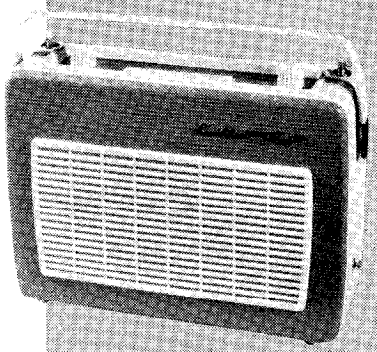
KURER AUTO

with or without FM.

A combined portable and car radio available in two versions.

STANDARD VERSION:		FM VERSION: (ill.)
long wave	2000 – 950 m	2000 – 950 m
medium »	600 – 182 m	600 – 182 m
short »	53 – 16 m	FM: 87,5 – 100,4 Mc/s.

Battery operated. Built-in ferrit antenna for the AM-bands. Telescopic antennas for the FM-band. The sets are easily placed in a mounting bracket under the dashboard. Excellent performance and HiFi reception.



KURER TRANSI

with or without FM.

Standard versions incorporating the long wave band and super short wave versions available. Battery operated. Built-in antennas for the AM-bands. Telescopic antennas for the FM-band. Supreme tone and sensitivity.

COMBI STAR

A combination 4 band radio receiver and a 45 rpm record player. Operated by 5 regular flashlight batteries. Built-in antennas. Incorporating long wave, medium and two short waves. 7 transistors and 2 diodes. Remarkable performance.

U. S. INFORMATION AGENCY, WASHINGTON, 25, D.C.

PREFACE

JEAN D'ARCY

Director Radio and Visual Services, Office of Public Information, United Nations. I october.

For the first time in its history, television has, as of 1962, reached its normal and true dimension. It has now become international. Until now, with the exception of Eurovision and Intervision, the audience to be considered when producing a programme for each transmitting station was a national audience. For each viewer, regardless of the number of stations he was able to pick up, only a national picture could be received. For each country television was operating within its national borders. For each nation there had been created a new national audio-visual language in pictures and sounds and a programme praised in one place was practically unintelligible in any other. In an age of world-wide liberation and expansion, television, thirty years after its creation and its recognition as an instrument of better understanding, was becoming a tool of restriction and nationalistic withdrawal.

Through the communications satellites, the final stage will be reached very soon now of a global and international television – of a television without frontiers.

With the possibility of direct reports in pictures via satellites of any event taking place the world over, television, for the production of programmes, is now potentially in a position to enjoy the same facilities press and sound radio have been utilizing for many years.

For the dissemination of programmes, communications satellites, by providing the possibility of sending a programme from station to distant station for redissemination, will really break the national barriers. As Eurovision and Intervision have already demonstrated, this stage is the more important one.

United Nations Television is primarily interested in this latter aspect and, in the future, will be making use of communications satellites for world-wide dissemination of United Nations information material. Since the launching of Telstar several demonstrations have been made, through the courtesy of the American Telephone and Telegraph Company, showing the various possibilities open to the television organizations in Europe for receiving a programme originating at the UN. But the reporting of events is also important for the United Nations. When a global system is in operation, it will be one of the duties of United Nations Television to report immediately, via Telstar, on any international event threatening world peace.

The establishment of a global system will take some years, but the tool very often shapes the situation. As the coaxial cables and the microwave links have led to the creation of Eurovision and Intervision, so the existence of communications satellites will lead to the creation of a world-wide network, and through this global network to the creation of a world broadcasting union.

This organization will have to be initiated by the present broadcasting organizations, and should not, in any case, be imposed upon them by any authority in the world. It is for the broadcasting organizations themselves, with the duty they have to their own national audiences, to maintain their independence and their sovereignty, to initiate the establishment of such an organization. It is not for any other organization to promote such a professional union. The global television system to come does not have to be a U.N. system, but the U.N. hopes to be one of its main users.

The services rendered in the past by the *World Radio Television Handbook* have been substantial. For every radio and television professional in the future, in this age of space communications, it would really be difficult to work without it.

ION PAS

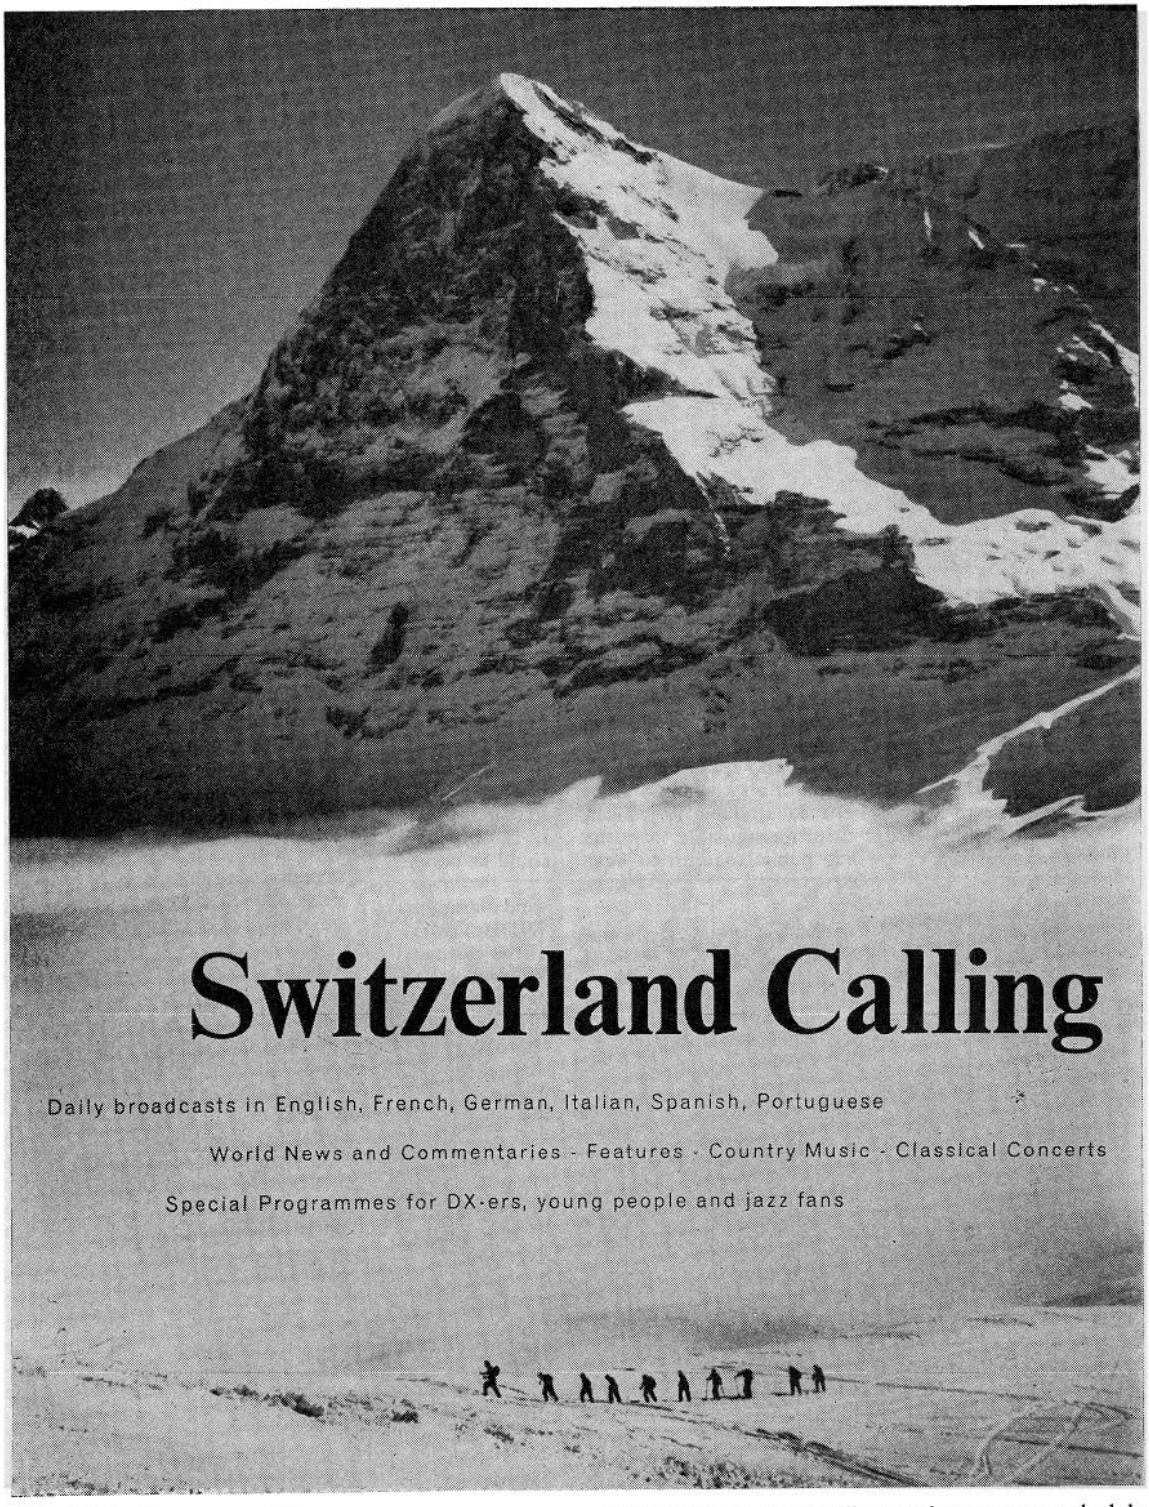
President of the International Radio and TV Organisation Chairman of the Rumanian Radio and TV

The role played by the Radio and TV in the life of the peoples all over the world is increasing considerably with every passing year. The important contribution made by the Radio and TV to the information of radio listeners and TV viewers, to the mutual knowledge of the spiritual values placed in the service of peace and progress, to the strengthening of the friendly relations among peoples, is generally admitted today.

The many programmes of the Rumanian Radio and TV serve these noble purposes. In order to achieve them, one of the preoccupations is that of strengthening the cooperation between the Radio and TV stations, of developing the exchange of experience and broadcasts.

Also in my capacity as President of the International Radio and TV Organisation I am convinced as well that the contacts between various international Radio and TV organisations could contribute to a thorough mutual acquaintance, to the development of an international cooperation in this sector of activity.

Along the line of the establishment of ever closer relations, the contribution of the *"World Radio Television Handbook"* is important and we are certain that in the future as well it will give a great help to the cooperation among the Radio and TV Stations all over the world for the promotion of understanding and cooperation among peoples.



Switzerland Calling
Daily broadcasts in English, French, German, Italian, Spanish, Portuguese

EDWARD R. MURROW

Director United States Information Agency.

The free flow of information across international boundaries is indispensable to world understanding and peace. In this sense, radio and television are harbingers of hope that people of all nations can come to trust one another and, thus, live in amity.

In the end of the day, however, it may well be that the example of my country will be more important than its words. If we in our capacious land can demonstrate social justice and a reasoned concern for the education, welfare and equality under law of all our citizens, we will be sustained in the belief that our voice is heard everywhere with confidence in its fidelity to the American dream of freedom for all.

COLIN MACKENZIE

Editor
Telecommunication Journal
International
Telecommunication Union

Our present age is notable, not only for the prodigious advance of knowledge, but also for the accompanying growth in the demand for information. The more that is achieved, the more people want to know, the more they need to know. Information media of all kinds and at all levels have never before been so strained to collect, classify and channel out in readily-assimilable form the knowledge that the world-wide public requires to have within reach. The collection and dissemination of information has thus grown to-day into a major industry in the service of all the others and of the public at large. It is a service particularly necessary where the scientific and technological achievements of the age are concerned. Among these, telecommunications command intensifying world-wide interest.

The International Telecommunication Union, the oldest of all the organizations which now make up the United Nations family, has increasingly come to regard the publication of information for the benefit of its Member countries as one of its basic duties. But it is clear to-day that it is impossible for a single organization to carry out the task of providing all the necessary information on all aspects of telecommunications throughout the world.

That is why so many people undoubtedly welcome the service performed by the *World Radio Television Handbook*. To produce a compendium at once so compact and so comprehensive clearly demands infinite care and effort. It is difficult to see, professionally, how a better job could be done.

RALF BRENT

President WRUL World Wide Broadcasting, New York City, N.Y.

World television has now been accomplished. Telstar is a success. But the problems which must be overcome are tremendous. International copyrights, union agreements, negotiations between government broadcasting systems and commercially operated systems are still to come.

But the primary problem facing live worldwide television is one shortwave stations such as WRUL have faced for years: *Time.*

A 4 PM race in Tokyo at the Olympics in 1964, will be received at 2 AM in New York City. A 9 PM program from New York will be received at 3 AM in Paris.

Will the combination of worldwide radio and television – worldwide supersonic jet travel and the coming world-wide market make it necessary for there to be a WORLDWIDE TIME? The rays of the sun travel across the face of the earth at the equator at about 1000 miles per hour. What will happen when air travellers will arrive at their destination *before they leave?*

A 2000 mile an hour jet will leave London at breakfast and arrive in New York before breakfast. Going back, the traveller will leave New York at Midnight and arrive in London one hour later in flight time, at six o'clock in the morning. No sleep is the result.

When the stock market in New York closes at 3:30 PM it is too late or too early in most of the world for the businessman to act on the information. If the merchant in Cairo wishes to talk by telephone to Honolulu, the person in Honolulu must be roused from bed to receive the call.

Time now is harnessed to the sun. Can we harness the sun to time? Can we devise satellites which will reflect the sun's rays to the dark side of the earth – so the world may operate on a single time? Everyone working at the same time – watching television at the same time – listening to radio at the same time – doing business at the same time – sleeping at the same time? – Too fantastic? Perhaps – but if communications become more important than daylight – if business and transportation need coincidental hours – it will come – WORLDWIDE TIME – with all the world on the same time.

TOKYO OLYMPIC GAMES 1964

Radio and Television Broadcasting Plan by Ichiro MATSUI Director Tokyo Olympics Broadcasting Headquarters

At the annual meeting of the International Olympic Committee held at Moscow in June 1962, the period of the 18th Olympic Games was decided from October 10th to 24th, 1964. The Japan Broadcasting Corporation (NKH) which is entrusted to make negotiations with foreign broadcasters concerning the broadcasting of the Games, received notices from 48 broadcasting organizations representing 42 countries signifying their intention to participate in the radio broadcasts of the Olympics and another 32 broadcasters representing 31 countries applied for TV broadcasts, as of October 10, 1962—just 2 years before the Tokyo Games.

During the 15-day period of the Games, 20 events will be held at about 30 sites. In consideration of the wishes of foreign broadcasters and past experiences in broadcasting the Olympic Games, NKH will establish about 320 radio and 180 TV broadcasting booths at all sites. NHK also plans to install 20 radio and 2 TV studios at a Radio Center, and 3 TV and 2 recording studios, 30 video tape and 8 kinoscope recording facilities at a TV Center.

With regard to the requirements of the foreign broadcasting organizations, in the case of radio, 32 broadcasters wish to make live transmissions from the competition sites to their respective countries and 41 broadcasters deferred broadcasts; in the case of TV, 17 stations wish to make video tape recordings, 18 stations kinescope recordings and 1 station plans to film—all of which under the present situation have to be airfreighted to their destinations. Among the events, for which broadcasts are desired by the foreign broadcasters, the most desired are track and field, which 60% wish to cover by radio and TV. Following track and field events, the order of preference is swimming, soccer, boxing, cycling and rowing in the case of radio; and swimming, soccer, boxing, rowing and gymnastics with TV. Especially, gymnastics and equestrian sports are desired for TV.

Sound for radio and TV as well as pictures from the competition sites will be relayed, in principle, to the Radio and TV Centers, respectively. Under the existing facilities, only radio sound can be relayed further to foreign countries by means of shortwave circuits. However, the under-mentioned three methods may become available in the future for relays by radio and TV.

The first is by communication satellites. TV relays between the US and Europe were successfully conducted in July 1962 by »Telstar« launched by the American Telephone and Telegraph Co. In order to utilize this method in the Tokyo Olympics, it is necessary to launch a communications satellite which orbits over Tokyo and to set up ground stations for relaying the signals to and from the satellite. The Japanese authorities concerned are now making preparations for the establishment of ground facilities.

The second method is the use of overland microwave relay network. This is now used by Eurovision and Intervision, etc. With regard to the relay from Tokyo to Europe and the US, one via Siberia, Southeast Asia, or the Aleutian Islands may be possible, but at present no concrete plan is being considered.

The third method involves the use of under-sea cables. It is expected that 128 telephone circuits between Tokyo and Hawaii will be completed in July 1964 jointly by Kokusai Denshin Denwa Co., Ltd. (Japan Overseas Telephone and Telegraph Co.), the American Telephone and Telegraph Co. and the Hawaiian Telephone Co. If this cable is connected with the existing cable connecting Hawaii and the American Continent, simultaneous radio relays can be made to Europe via America, and deferred telecasts will be possible by the method of transmitting film pictures frame by frame.

It is estimated that by the time of the Tokyo Olympics in October 1964, the number of TV sets in the world will reach 120 million and viewers 600 million. Just like the Olympic motto of »citius, altius, fortius« (faster, higher, stronger), NHK ardently wishes to transmit radio and TV broadcasts »faster and wider« to all listeners and viewers.

PREFACES *(continued from page 6)*

DOL RAMLI

Acting Director
Department of Broadcastng.
Federation af Malaya.

The power of Television and Sound Radio for good or ill is universally acknowledged. As such, no responsible country can afford to neglect its own Broadcasting service or maintain an air of aloofness with its neighbours. The increasing interest displayed by Asian countries in what goes around them, the need to communicate effectively within and without their own geographical boundaries, the desire to co-operate and learn from one another, and to entertain, inform and educate their own teeming millions – constitute welcome manifestations which have resulted in the holding of a series of conferences by Asian broadcasters since 1957. This year's Asian Broadcasters' Conference held in Kuala Lumpur was the best attended and most fruitful in terms of numbers, high level participation and concrete results. No doubt this manifestation augurs well for the future of not only Asian broadcasting but also desirably of inter-continental communication. Programmes of mutual assistance and understanding inside and outside Asia in all spheres of human activities should be encouraged to develop along healthy lines with global interests in mind.

To this end, the existence of every conceivable aid in the betterment of international communication and understanding is welcome. As such, the *World Radio Television Handbook* serves a useful purpose. I take this opportunity, therefore, to urge all broadcasting authorities of whatever political and ideological persuasions to provide accurate up-to-the-minute information and so continue to make the *Handbook* as authoritative as it has been in the past.

ref: GEN-21/62

Many's the face that has been saved by the safety pin... dependable little thing. On such a tiny item has embarassment been checked and success assured. Your equipment and your ultimate success are geared to the reliability of every component: the chain is only as strong as its weakest link, and catastrophy can follow just one small failure. You want the best. We know that. You want top performance and long life from your components. It's up to us to give you top quality, and our aim has been, and continues to be, the supply of components as reliable as modern techniques permit. Those who seek high standards in electronic component parts rely on Philips.

Specialized Commissions: Technical Commission: Chairman A. Kozlowski, Polish P.R.; Radio Prgr. Commission: Chairman J. Tempe, Hungarian P.R.; Television Prgr. Commission and Intervision Council: A. Hradecky, Czechoslovak S.R.
Publications: Review of the International Radio and Television Organization (OIRT) "Radio & Television" in English, French, Russian, Chinese and German, issued every two months. Monthly OIRT Information, and quarterly Catalogues of prgr's suitable for exchange: a) radio, b) television.
Meetings: General Assembly every two years, Administrative Council every one year.
Relations with all important organizations active in the field of radio and television.

ASOCIACION INTERAMERICANA DE RADIODIFUSION (AIR)

President: The Mexican Broadcaster Lic. José Luis Fernández. Temporary Address, Paseo de la Reforma 400–302. México, D.F. Vice Pres's: Sr. Fernando Eleta A. (Apdo 1795, Panamá), Sr. Félix Cardona Moreno (Apdo 3955, Caracas, Venezuela). Secr.: Sr. Boris Eserski (Apdo Postal 720) San Salvador, El – Salvador).
AIR is an association of the broadcasting corporations of the American countries. Founded in 1946 it represents more than 5000 broadcasting and 400 television stations. Its purpose is to preserve free and stable broadcasting, promote cooperation between broadcasting corporations and the public authorities, to raise the cultural level of the peoples, to work for the preservation of freedom of utterance and instruction and a closer feeling of association between the private broadcasting corporations on the American Continent. AIR has agreed with Sociedad Interamericana de Prensa about the revision of the so-called Panama Doctrine for the purpose of increasing the practical effectiveness of that pact and of making it a permanent means of defence for the preservation of democratic principle. AIR is recognized by the United Nations and collaborates with UNESCO, with the International Union of Telecommunications and with the organization of the American States. AIR has subscribed to the "Panama Doctrine" in which the American Radio and Press declare themselves united against any attack on individual liberty and restriction of the freedom of utterance. During the current year the institution has had intensive activity in defense of freedom of information in connection with events occurring in several countries.

AFRICAN RADIO TELEVISION UNION (URTNA)

The union calls for strengthening of the bands of brotherhood and amity existing between all peoples of the continent of Africa. The African Radio Union has as its aim the creation and consolidation of exchange and cooperation within the sphere of radio and television in order to attend to the interests of African broadcasting and to coordinate participation in international conferences.

The General Assembly of the Union of National Radio and Television Organisations in Africa met in Lagos 25th to 29th September 1962.

Participants at this Assembly include the Directors-General, Directors and Chief Engineers of Radio and TV Organisations of the following 23 countries: Cameroun, Congo (Braz.), Congo (Leo.), Dahomey, Ethiopia, Ghana, Guinea, Ivory Coast, Liberia, Libya, Mali, Mauritania, Niger, Nigeria, Republic of Central Africa, Senegal, Sierra Leone, Tanganyika, Tchad, Togo, Tunisia, United Arab Republic, Upper Volta.

Important issues decided by the Assembly include: The ratification of the Statutes of URTNA—Decision to locate the seat of the Union in Dakar, Senegal, and the technical Centre in Bamako, Mali—That the seat of the Union will be the Administrative Centre and would in the meantime handle the business of Programme Exchange until a Programme Exchange training Centre is established—Election of the Administrative Council was as follows: President – Guinea: Diallo Alpha. Vice-President: Thiam Amadou, Ivory Coast – Administrators: Nigeria, Ghana, Togo, Tunisia, United Arab Republic, Senegal, Cameroun. The Administrative Council is entrusted to apply to the United Nations and its specialized Agencies.

The next General Assembly is fixed and shall sit in Brazzaville, Congo in October, 1963 on a date to be notified.

FOURTH ASIAN BROADCASTERS' CONFERENCE 1962

The Fourth Asian Broadcasters' Conference in Kuala Lumpur (24th–30th August, 1962) proved to be the best attended since the series started in 1957. The Conference was opened by the Prime Minister of Malaya, Tengku Abdul Rahman. The Chairman was Mohd. Ismail Yusof and Secretary General Mohd. Sopiee. Among the many significant decisions taken were:

1) The decision to form an organised body for the first time, viz. Asian Broadcasting Union. The countries adhering to this decision are as follows: Australia, China, India, Indonesia, Japan, Korea, Laos, Malaya, New Zealand, Pakistan, Philippines, Saudi Arabia, Thailand, Turkey, United Arab Republic and Vietnam. Burma has not been included in the list at the request of its delegation.
2) The Conference has accepted the invitation of the Government of the Republic of Korea to hold the 5th Asian Broadcasters' Conference in Seoul approx. May 16th, 1963.
3) To be accredited to UNESCO on the basis of mutual information relationship.
4) The Conference deprecates the jamming of broadcast transmissions and calls upon the United Nations and other international agencies to take appropriate action against this harmful practice.
5) The Conference recognises that the highest aim of broadcasting to other countries is to promote enlightenment, understanding and goodwill between peoples.
6) The adoption of a common Broadcasting Code and of Ethics for Overseas Broadcasting.
7) Publication of a Journal for Asian Broadcasters.
8) Exchange of Programmes, Information and Personnel.
9) Appointment of Liaison Officers in member countries and territories.
10) Recommendation for those countries embarking on TV to consider the adoption of the 625-line Western European standard.
11) To set up in progressive stages necessary facilities for relay of Telecasts in Asian countries – ASIAVISION.
12) To carry out technical research for better Radio and TV relays during the 1963 Olympic Games in Tokyo.

The following were member countries and territories of the Programme and Engineering Committees: Burma, India, Japan, Korea, Laos, Federation of Malaya, Pakistan, Philippines, Saudi Arabia, Thailand, (Turkey), United Arab Republic, Vietnam, Australia, Brunei, Hong Kong, (New Zealand), North Borneo, Sarawak, (United Nations and UNESCO), and Singapore. (Countries in brackets only in the Programme Committee).

In connection with the A.B.C. Conference, the Planning Committee also arranged a successful Radio and TV Exposition at the magnificent new indoor Stadium called "Stadium Negara" as well as a Radio and TV Engineering Symposium.

UNIVERSITE RADIOPHONIQUE ET TELEVISUELLE INTERNATIONALE (U.R.I.)

Founded by Radiodiffusion Télévision Française.

Addr.: 4, rue Sainte-Anne, Paris 1°, France. **L.P.:** Pres.: Théo Fleischman. Adm. Dir. Gen. Radiodiffusion Nationale Belge – Gen. Sec.: A. Lanoux.

Member of the Permanent Committee: **Radio:** R. Dovaz (Switzerland); E. Gampe (Austria); R. Behal (Czechoslovakia) – **Télévision:** S. Pugliese (Italy); Niels-Erik Baehrendtz (Sweden) – **Secr.:** Head of Coordination Dept.: G. Druon; Cultural Adviser: L. Foucher; Scientific Adviser: P. Ostoya; Chief Intern. Sce.: O. Duchateau.

38 countries have joined the work of U.R.I.

THE INTERNATIONAL FILM AND TELEVISION COUNCIL (I.F.T.C.)

Non-governmental organization, independent, non-profit-making, and open to representative international federations or associations whose work lies in the field of the film and television.

The Council seeks to further the work of its members by arranging meetings and consultation between them, and acting as a link for the exchange of information and for cooperation in many ways. It thus provides, for the first time, machinery for international action in both film and television.

Pres.: John Maddison – **Vice-Pres.:** Charles Delac and Jean d'Arcy – **Hon. Treasurer:** Jean Jay – **Hon. Secr. and Dir. of Rome Office:** Mario Verdone – **Administrative Secr.:** Sylvia Antebi. – **Addr.:** via Santa Susanna 17, Roma (Italy).

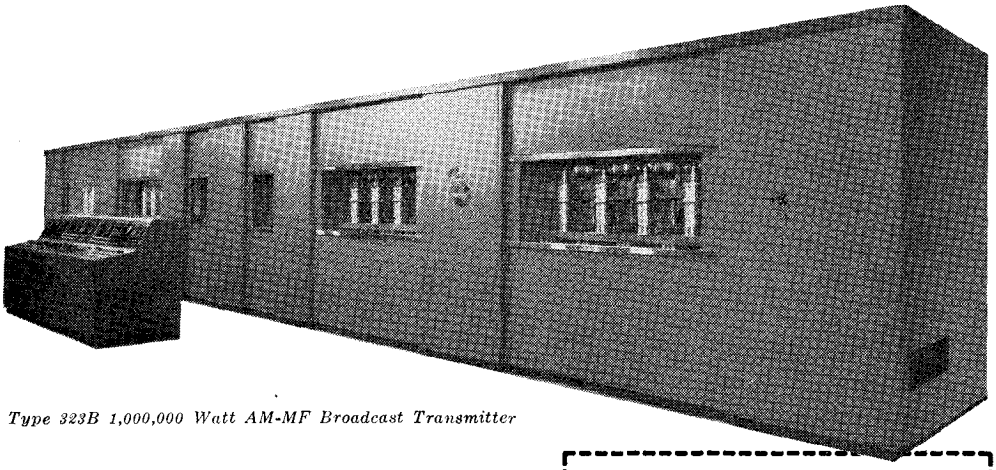
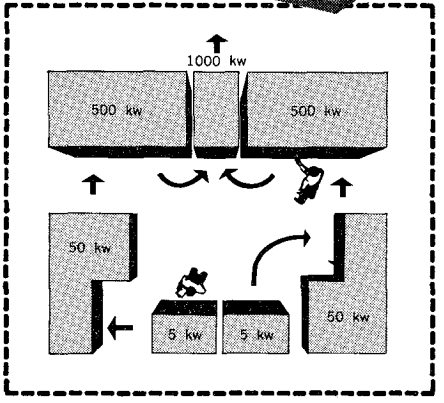
Continental transmitters easily E-X-P-A-N-D from

5,000 watts to 1,000,000 watts



Type 323B 1,000,000 Watt AM-MF Broadcast Transmitter

This super power broadcast transmitter delivers 1,000,000 watts of continuous carrier power to the antenna system. It consists of two Continental Type 320B 500,000 watt transmitters which are combined through network to provide the power output of 1,000,000 watts. Continental's Type 317B 50,000 watt transmitter serves as the driver stage for the Type 320B, and Continental's Type 315B 5,000 watt transmitter is the driver for the 317B. It is feasible to begin initially with Continental's Type 315B 5,000 watt MF broadcast transmitter and eventually have the Type 323B 1,000,000 watt transmitter simply by adding the various power groups. Continental developed the first super power 1,000,000 watt broadcast transmitters for the Voice of America. The Type 223B 1,000,000 watt LF transmitter was installed at Munich in 1953; similar Type 323B 1,000,000 watt MF transmitters were installed at Okinawa and Manila in 1953. Continental is currently building and installing a 1,000,000 watt broadcast transmitter for a foreign government.



POWER INCREASE CAPABILITIES

Diagram shows how Continental's Type 315B 5,000 watt broadcast transmitter becomes the driver unit for the Type 317B 50,000 watt broadcast transmitter; and in turn, how the Type 317B serves as the driver stage for the Type 320B 500,000 watt broadcast transmitter. Two Type 320B transmitters are combined through network to provide 1,000,000 watts of power to the antenna system.

EUROVISION'S PROGRESS

by G. Hansen
Director of the E. B. U.
Technical Centre

The progress of Eurovision in 1962 has been remarkable. The forecasts given in the 1962 yearbook have been fulfilled, and even exceeded. Let us give a few figures. The Television Services of the Members of the European Broadcasting Union in seventeen different countries are linked by Eurovision. The total length of the permanent television networks of these Services is approximately 70,000 km. The number of television broadcasting stations transmitting their programmes is more than 1,400 and the number of receivers served by all those transmitters on 1st January, 1962, was about 28 million. The number of transmissions controlled by the E.B.U. International Television Coordination Centre has anaverage of 31 per week. This figure includes the daily exchanges of news items, but not the straightforward relays between neighbouring countries,

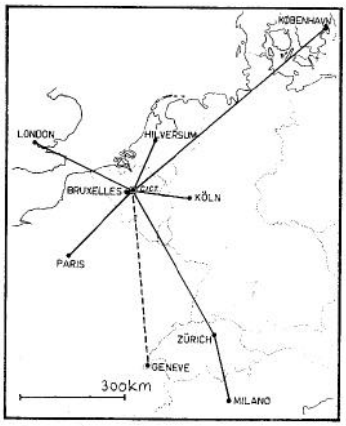
The daily news exchanges are a typical development of Eurovision. Since 1st January, 1962, they have been taking place between the Television Services of Belgium, France, Italy, the Netherlands, other services joining in occasionally. Every day before noon each Service informs the E.B.U. Administrative Office at Geneva of the news-items that it has to offer on that day. These offers are then passed on to all the Television Services that participate in the exchanges . By 14.00 CET, the Eurovision Planning Unit in the Technical Centre is informed of the desired participation in each item offered; it then places (by telex) the orders for any circuits, sound, vision and control that are not permanently available. At 16.30 the pre-transmission tests of the vision circuits begin and at 16.40 there is a telephone conference of the News Editors of the various Television Services concerned. Beginning at 17.00 each Service in turn describes the items that it will contribute, giving the duration of each sequence and the necessary background information. At approximately 17.15, the actual picture transmission takes place and may continue up to about 17.30. Each Service in turn sends its contribution which is simultaneously recorded by all the other Services.

After 17.30 each Service edits as required the items that it has recorded and provides locally a suitable commentary in the appropriate language; ready for its news bulletins of the same evening.

Such a scheme would not have been possible if a basic sound network had not been permanently available for the common use of the Members of the E.B.U. participating in Eurovision. Since 1st January, 1962, the most important sound and control circuits have been leased by the year (instead of being rented by the minute as before). Fig. 1 shows this basic network. It is available at all times to carry the sound complement of television programmes. In order to gain the fullest possible return for the rental, the links have also been made available for the exchange of sound broadcasting programmes; this facility has been used to a great extent by the E.B.U. Member's sound broadcasting services and will probably be used even more in the future. To enable the use of the permanent sound network at all times of the day, and also because of the greater number of television programmes exchanged in Eurovision, the International Technical Coordination Centre is now manned regularly every day between 09.00 and 23.30.

In 1962, exchanges of programmes between Eurovision and Intervision, that is between Western and Eastern Europe, have again increased. Morever, the launching of Telstar on 10th July has now made possible direct exchanges across the Atlantic. This is undoubtedly the greatest event as far as television programme exchanges are concerned. It was fittingly marked by organising a special exchange of programmes on 23rd July between the E.B.U. Members in Europe and the E.B.U. Associate Members in N. America (A.B.C., C.B.S., N.B.C., C.B.C.). The America-to-Europe programme was transmitted on the 124th pass of Telstar, whereas the Europe-to-America programme was transmitted on the 125th. The European programme included 21 contributions from 9 countries, lasting between 18 seconds and 2 minutes each. The E.B.U. provided the Master Control in Brüssels, with accommodation for the producer and programme director. A small studio was improvised in the C.I.C.T. maintenance workshop, whence the programme was presented by a narrator. Both programme were broadcast by the 1,400 transmitters in Europe mentioned above, and by 600 transmitters in the United States. 80 million television sets could receive them. Never before has a television programme reached such an audience.

Since then, many television programmes have been transmitted through Telstar. Special mention might be made of the Europe to America programme organised for the 10th anniversary of C.B.C.'s television Service on 6th September and the United Nations programme on 17th September, which utilised the same Telstar pass for transmission from Europe to America and America to Europe, with a switching time in between of two minutes. Telstar has been an outstanding success and all credit must be given to the A.T. & T., N.A.S.A., G.P.O. and French P.T.T. One should not forget however that it is an experimental undertaking.



Sketch-map showing the basic sound-network rented in 1962 by the E.B.U. Members participating in Eurovision. Each interconnection consists of a programme-sound circuit in each direction and a control-telephone circuit, except in the case of the Brussels-Geneva link, which is for telephone traffic only. Extensions to the basic network are rented by the minute for each transmission individually.

HAMMARLUND

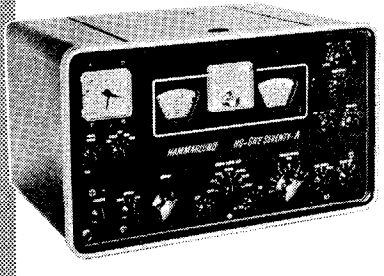
COMMUNICATIONS EQUIPMENT

Approved throughout the world by the most renowned technicians — both military and amateur

HAMMARLUND receivers and transmitters are products of the world's leading manufacturer of communications equipment, combining the latest technical developments with many unique features that have made HAMMARLUND products outstanding for more than 50 years . . .

HX-50 **New, Compact Filter-Type Transmitter.**

Loaded with design extras that give you highest dollar value. Rated at 50 watts output, it offers more for the money than other comparably priced transmitters. It covers all the amateur bands 80 to 100 meters (160 meter band optional). Includes features usually found only in larger, more expensive units. Readability to 2 Kc/s or better. Stability after warmup is better than 250 cps. Superior performance in upper or lower SSB, AM or CW.

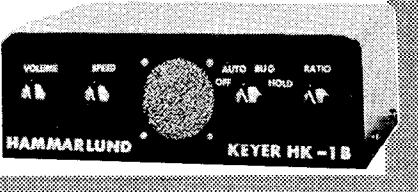


HQ-170A **The Finest Amateur Receiver on the Market.**

Offers everything the amateur needs for solid contacts in SSB/CW and AM/MCW operation. Especially designed to meet ALL the requirements of modern communications reception, offering a practically endless combination of tuning techniques. A 17-tube triple conversion superheterodyne circuit with automatic noise limiter and the exclusive Auto-Response. Full dial coverage of 6, 10, 15, 20, 40, 80 and 160 amateur bands.

HK-1B **Electronic Keyer.**

A compact, fully transistorized code generator that combines all of the desirable features of Electronic Sending with distinctive dot/dash control to give your messages the personal touch. Features: Versatility, Simplicity, Built-In-Protection and complete portability.



Write today for catalogs and prices on these and other HAMMARLUND communications equipment.

HAMMARLUND Manufacturing Company, Inc.
INTERNATIONAL DIVISION: 13 East 40th Street, New York 16, N. Y.

PHILIPS

symbol of quality PHILIPS **sign of perfection**

for dependable transmission and reception

TRANSMITTING EQUIPMENT:

AM Medium Wave transmitters
AM Short Wave transmitters
FM transmitters
TV transmitters for band I, III, IV and V
Video input and correction equipment
Radio relays for sound and video
Aerial systems
Mobile and portable radio stations

RECEIVING EQUIPMENT:

Communication receivers
Radio receivers (AM and AM/FM)
All-transistor radio receivers (AM and AM/FM)
Stereophonic radio gramophones with reverberation
All-transistor car radios (AM and AM/FM)
Pocket and portable radios (AM and AM/FM)
Television receivers 19", 21", 23" for all transmission systems

STUDIO AND SOUND EQUIPMENT:

All types of microphones, loudspeakers, amplifiers, tape recorders for amateur, semi-professional and professional purposes
Audio and Video equipment for Broadcasting and TV studios and for outside broadcasts
Colour Television equipment for Studios and TV laboratories

MISCELLANEOUS:

Closed-circuit television equipment
Large-Screen TV equipment
Gramophone records
Record players and changers
Electrophones
High-Fidelity equipment
Stereo-reproduction equipment
Pick-up heads
Lighting equipment for studios and general purposes
Measuring equipment for radio and TV Service

INTER-CONTINENTAL TELEVISION PRESENT AND FUTURE

By Edgar T. Martin, Engineering Manager, VOA and George Jacobs, Chief, Frequency Division, VOA.

On July 23, 1962, an exciting new chapter was written into the history of international communications. On that day, the Old and the New Worlds were linked together by live television broadcasts for the first time.

This memorable event was made possible by the TELSTAR communication satellite. Launched by the United States of America on July 10, 1962, TELSTAR is an experimental active repeater satellite built by the American Telephone and Telegraph Company. TELSTAR receives microwave radio signals beamed to it from the ground, amplifies the signals *ten billion times,* and retransmits them on another frequency to specially designed receiving stations on the ground. In essence, the satellite functions as "a microwave tower in the sky", and from its great height (which varies between 1000 and 6000 kilometers) TELSTAR can relay signals over distances of many thousands of kilometers.

On July 23, during its 123rd orbit around the world, the first live television broadcast was relayed by TELSTAR from North America to Europe. During the twenty-two minutes that TELSTAR was high over the Atlantic Ocean in line-of-sight with both continents, an audience in eighteen European countries, estimated at 100 million, saw live pickups of President Kennedy's news conference, an American baseball game, U.N. headquarters in New York City, and glimpses of North America from Quebec to the Mexican border, and from the Atlantic to the Pacific.

The program, which originated in the United States and Canada, was transmitted by coaxial cable and conventional microwave systems to the American Telephone and Telegraph Company's earth terminal station near Andover, Maine, in the northeastern tip of the United States. From Andover, the program was beamed to the TELSTAR satellite by a horn reflector type antenna 161 feet in length, and 60 feet across at its mouth. The antenna is completely encased within a 210 feet diameter radome. TELSTAR amplified and relayed the broadcast to a similar earth terminal station located at Pleumeur-Bodou, in Brittany, France. From Brittany, the program was transmitted by conventional microwave and coaxial cable circuits to Eurovision headquarters in Brussels, where it was distributed over Eurovision networks to eighteen European countries. The technical quality of the picture was excellent.

During TELSTAR's next orbit, 2 hours and 40 minutes later, Europe transmitted a 19-minute live broadcast to North America. More than 100 million television viewers in the United States and Canada became arm-chair tourists as Eurovision cameras switched from the Arctic Circle in northern Sweden to Sicily in the Mediterranean, and from Belgrade, Yugoslavia, to the western tip of England. Viewers saw the midnight sun low in the northern sky, rode along the Champs-Elysees in Paris, heard opera from the Baths of Caracalla in Rome, saw dancing horses at Vienna's Spanish Riding School, and heard the roar of blast furnaces on the Rhine. The program coordinated through Eurovision headquarters in Brussels, was transmitted by conventional coaxial cable and microwave systems to an earth terminal station at Goonhilly Downs, in Cornwall, England. (Incidently, this station is located within a few miles of the spot from which Marconi first bridged the Atlantic with radio in 1901.) An 85-foot diameter parabolic antenna at Goonhilly Downs beamed the Eurovision broadcast to TELSTAR, which amplified and relayed it to Andover, Maine. At Andover, the program was distributed through conventional ground circuits to the American and Canadian television networks. The quality of reception was excellent.

The outstanding success of the TELSTAR trans-Atlantic television broadcasts, and the significance they hold for the future, warrant enthusiasm. Important as it is, however, TELSTAR is only an experiment, and in itself does not represent the design of an operational communications system. Facilities for regularly relaying

(Left) Edgar T. Martin, Engineering Manager, Voice of America. (Right) George Jacobs, Chief, Frequency Division, Voice of America.

GEORGE JACOBS

George Jacobs was born on July 16, 1924, in New York City. He received his B. E. E. degree from Pratt Institute, Brooklyn, 1949, and his M. S. E. E degree from the University of Maryland in 1960.

Mr. Jacobs is a representative of the Interdepartment Radio Advisory Committee (IRAC) and several other policy-level U. S. Government committees in the field of telecommunications. He has served as a delegate to several international broadcasting and telecommunication conferences, including the 1959 ITU Administrative Radio Conference, where he was the U. S. spokesman for high frequency broadcasting. Most recently, he attended the Study Group IV meetings (Space Communications) of the C. C. I. R. held in Washington during March, 1962.

Mr. Jacobs is a Senior Member of the IRE, a member of URSI, and a registered Professional Engineer in the District of Columbia.

EDGAR T. MARTIN

Edgar T. Martin was born on May 1, 1918, in Princeton, West Virginia. He received his B. S. E. E. in 1938 and his M. S. E. E. in 1953, both from Virginia Polytechnic Institute. He also holds an M. A. in Government from American University, conferred in 1957 and an LL.B. from George Washington University. In 1959, he earned his LL.M. from Georgetown University.

He is a registered Professional Engineer in Virginia and the District of Columbia, and he is also a member of the Virginia Bar. He has attended more than a dozen major international conferences dealing with broadcasting and telecommunications, and was a delegate to the ITU's Administrative Radio Conference held in Geneva.

Left: A close-up of TELSTAR experimental communication satellite which serves as a microwave relay in space. TELSTAR made it possible to exchange live television broadcasts between North America and Europe for the first time, during 1962. The satellite is covered by 3600 solar cells which obtain energy from the sun for power. Girdling the center of the satellite are two broadband microwave antennas, one of which is used for receiving and the other for transmitting.

Right: How active repeater satellites, like the American TELSTAR and RELAY, relay television broadcasts between continents.

television broadcasts by communication satellites may still be several years off.

To hasten the development of an optimum operational satellite communication system, the United States plans a variety of experiments during 1963. As many as six low- or intermediatealtitude satellites of the TELSTAR and RELAY active repeater types are expected to be placed in orbit during the year. It would require approximately 40 of these satellites, orbiting between 1000 and 15,000 kilometers (600 and 9,000 miles) to provide continuous communication on a world-wide basis. At least two high-altitude, synchronous, active repeater satellites are also expected to be placed in orbit during 1963. Called SYNCOM, these satellites would orbit at 36,000 kilometers (22,300 miles), from where a fixed relationship would be maintained continuously with any point within a visible area equal to one-third of the earth's surface. The United States plans to launch its second ECHO passive communication satellite towards the end of 1962. ECHO II, a rigidized 135-foot diameter balloon, will act as a giant man-made reflector of radio signals in the UHF and microwave regions. This will be followed by additional launchings of passive communication satellites during 1963. It is planned to eventually design an optimum operational system from the detailed technical data obtained from these experiments. The initial phase of such a system may be in operation as early as 1965.

The success of TELSTAR raises the possibility of broadcasting directly to a listener's home from a satellite relay transmitter. In such a case, the transmitter in the satellite must be of sufficient power to radiate a signal strong enough to be received on the average home televison receiving installation. Calculations show that it would require a satellite in a synchronous orbit, with a transmitter of several hundred kilowatts, to provide direct television transmissions. Many formidable technical problems remain to be solved before this can be achieved, and it appears doubtful if broadcasting directly from satellites can be achieved as economically as present day conventional broadcasting systems.

The pattern of inter-continental television during 1963 seems clear. The bulk of exchanges will continue to be on film and video tape, often flown to far-off destinations in a matter of hours by speedy jet aircraft. A number of trans-Atlantic experimental television relays may take place during the year as a result of the large number and variety of communication satellites that are to be tested. Both Germany and Italy are expected to participate directly in these experiments as earth terminal stations are planned to be put into operation in both countries during 1963. Inter-continental television on an experimental basis may be extended to South America and the Far East during the year, upon the completion of earth terminal stations under construction in Brazil and Japan.

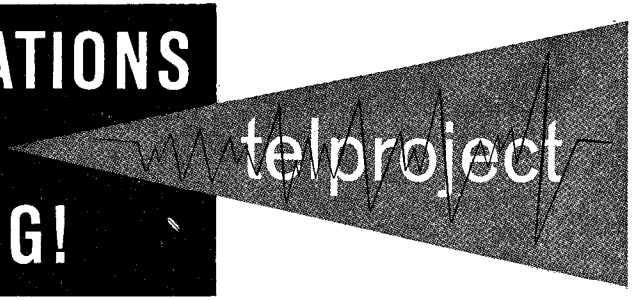
When an operational satellite communication system is eventually established, the amount of inter-continental television material relayed will no doubt depend on the cost of the relay as compared to the exchange of film and video tape. It is not expected that direct broadcasts from satellites to the listener's home will be technically possible or economically justifiable in the foreseeable future.

President Kennedy recently said, "The benefits which a communications satellite system should make possible within a few years, will stem largely from a vastly increased capacity to exchange information cheaply and reliably with all parts of the world by telephone, telegraph, radio and television. The ultimate result will be to encourage and facilitate world trade, education, entertainment, and many kinds of professional, political and personal discourse which are essential to healthy human relationships and international understanding."

The communication satellite experiments planned for 1963 are expected to be a big step toward the realization of these benefits.

a realistic practical approach to

COMMUNICATIONS SYSTEMS ENGINEERING!



Tele-Projects Corporation provides a complete service, available for your entire project or any portion that you may require.

The service includes the following:

- **ECONOMIC STUDIES**
- **SYSTEM DESIGN**
- **ANTENNA DESIGN**
- **ROUTE SURVEYS**
- **PROPAGATION TESTS**
- **SPECIFICATIONS**
- **INSTALLATION**
- **TRAINING**
- **CONSULTING**

Our world-wide experienced staff of engineers stands ready to serve you, efficiently and economically, on any project in the Telecommunication, Broadcast or Television Fields. Installations in more than 75 countries throughout the world, under every climatic condition, give us a firsthand knowledge applicable to any specific requirement on any job.

Where desired, French or Spanish speaking Installation and/or Training Personnel are assigned.

HOW TO USE THE WORLD RADIO TELEVISION HANDBOOK

The World Radio Television Handbook is designed to help the international radio listener obtain maximum enjoyment from his receiver.

The first section of the Handbook contains instructive articles relating to broadcasting, information regarding broadcasting and television organizations, and tables of practical value to listeners.

The main section of the book (pages 70–204) contains detailed information, by country, of the **Radio Broadcasting Stations** and broadcasting organizations of every country in the world, including names and addresses of broadcasting companies, names and titles of leading officials, lists of broadcasting stations in each country, including frequencies, wavelengths, transmitter power, call signs (if used), and station names. Program information is also listed, including times, frequencies, and beam areas of the broadcasts in each language.

Information about **Television Stations** is provided in the section following the radio section, including names and addresses of Television companies, location, power and channel of Television stations, and program schedules of these stations.

A listing by frequency and wavelength of the shortwave stations of the world, and long and medium wave stations of Europe-North Africa-Near East is presented in the back of the Handbook, for use in facilitating the identification of stations.

Short-wave stations may be used either for domestic broadcasting to listeners in the same country or for international broadcasting directed to listeners in other countries.

International Short-wave stations usually employ directional antennas to beam their programs to particular areas on frequencies calculated for best reception. Most international broadcasts are scheduled for the evening hours in the intended reception area, but some are in the morning or at other times during the day. The reception areas give their names to the services: European Service, Far Eastern Service, North American Service, etc. Languages employed are those of the listeners in the area to which the broadcast is directed, also the language of the transmitting country for reception by persons understanding that language.

Best reception is usually obtained from transmissions directed to your area. However, there is a considerable amount of overlapping between many service areas and, therefore, it is often possible to obtain good reception of programs beamed to adjacent areas, and sometimes, even of programs directed to distant parts of the world. Short-wave propagation conditions change continually because of the influence of daylight and darkness, seasonal effects and solar activity. Consequently, good reception requires frequency change from time to time.

Domestic Short-wave stations are usually of lower power than international stations, and generally use non-directional or wide beam antennas, in order to reach local or national audiences. These stations make fewer seasonal frequency changes, and many operate on the same channel for both day and night operation. The stations are utilized to reach areas of a country where coverage by medium and long wave stations is not adequate.

Long and Medium wave stations are used mainly for transmitting programs to listeners in the country in which the stations are located. These stations vary from powerful transmitters capable of being heard throughout the country to low power stations intended only for a small area in the vicinity of the transmitter.

FM (Frequency Modulation) Stations operate on very high frequencies (VHF) ranges of 88–108 Mc in the Americas and 87–100 Mc in other areas, and provide interference-free reception over a short radius. Most FM stations relay of programs of a medium or long wave station.

Frequency and Wavelength – Frequencies are measured in kilocycles per second (kc) and megacycles per second (Mc). A kilocycle is 1000 cycles. A megacycle is 1000 kilocycles. Wavelengths are measured in meters.

Program times used in the listings are based on the 24 hour clock. Midnight is 00.00 hours, 3 a.m. is 03.00 hrs, 9 a.m. is 09.00 hours, and midday is 12.00 hours. Then, instead of starting another 12 hour cycle (p.m.), under the 24 hour system the hours increase until midnight. Thus 3 p.m. is 15.00 hrs, 10 p.m. is 22.00 hrs, and so on until 23.59 (11.59 p.m.) is reached and a new 24-hour cycle starts. This system eliminates any confusion between times a.m. and p.m.

Time Conversion: All programs are listed in GMT (Greenwich Mean Time). To convert from GMT to your local time, refer to the World Time Table on page 55 to determine how many hours your time is ahead or behind GMT, and add or subtract that amount in order to convert to your clock time. For quick conversion, it is useful to write the GMT hours, 00 to 24, down one side of a sheet of paper, and then enter the correct local time opposite each GMT hour. Summer time or Daylight Saving time adds an hour to local time, so this should be taken into account in countries where it is utilized.

Program schedules: The program schedules of each country are divided into Home Services and Foreign Services. The Home Service programs are arranged by language, and by program services or networks. The Foreign Service transmissions are generally arranged by beam area, and by language for each beam area. The times and frequencies of the programs in each language are listed together, in order to facilitate the determination of the times and frequencies of the broadcasts in each language. The times of news broadcasts and other program features are also included.

Therefore, if you wish to hear a broadcast in a particular language from a country, refer to the listing for that country of the time and frequency of broadcasts in that language. Most broadcasts are transmitted on more than one frequency, so try the various frequencies listed, to determine which one is received best at your location.

Identification of Stations: Most stations in Europe, Middle East Africa and Asia identify by announcing their station name and location. Most stations in North America and Oceania identify by the use of a call sign of three to five letters or a combination of letters and figures,

GREETINGS FROM

RADIO ★ PRAHA

ČSSR

RADIO PRAGUE

Broadcasting daily in English, Arabic, Czech, Slovak, French, German, Greek, Italian, Portuguese, Serbo-Croat, Spanish and Swedish – programmes of world news and views, reports from Czechoslovakia, music. Programmes also include answers to listeners, musical requests and regular columns for radioamateurs, DXers, and stamp collectors.

A MESSAGE TO SWLs

Radio Prague is carrying out a continuous reception survey. *All correct reception reports are verified.* Listeners participating regularly in the monitoring work for the short-wave propagation department receive valuable souvenirs from Czechoslovakia.

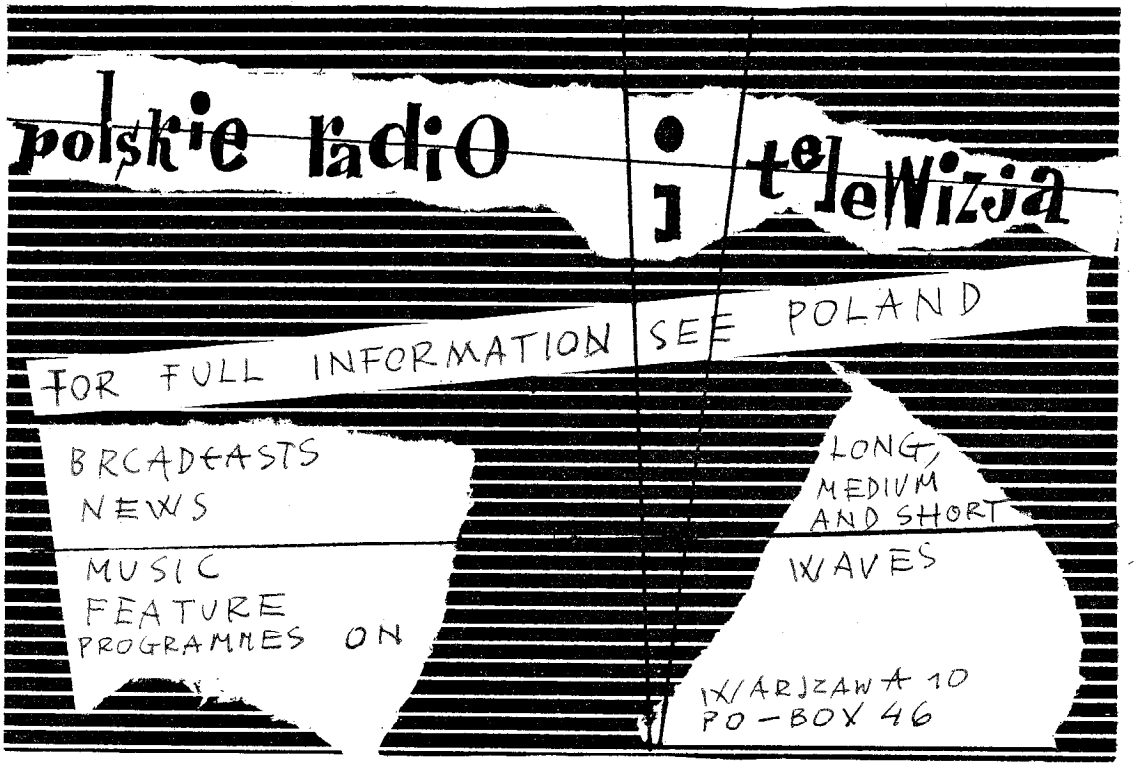
RADIO PRAGUE – PRAGUE 2 – CZECHOSLOVAKIA

See editoral text page 72



of which the first, or first two, denote the nationality in accordance with the international list of prefixes. Most stations in Latin America use a call sign (sometimes not frequently announced), a station name, and location.

In addition, many stations use musical interval signals at sign on and between programs, in order to help listeners to find the station on their dial and identify it as the desired station. These interval signals are included in the country listings.

How to Identify a Station by Frequency or Wavelength: When you hear a station that is unknown to you, first try to determine some clue to its identity by attempting to determine the language, noting the type of program, etc. Then, note the approximate frequency or wavelength indicated on your dial, and turn to the table "Short-wave Stations of the World" in the back of the Handbook, and ascertain what stations operate in that vicinity. Next, check the program listings to determine which of the stations are scheduled to operate at that time of day, and which are most likely to be audible at your location, depending on the power and distance away. For definite confirmation, it is desirable to wait for station announcement or interval signal.

Frequency Changes: The frequencies listed are those which were scheduled for use at the time of publication. However, due to a number of reasons, including interference and changes in propagation conditions, it may be necessary for a country to make frequency changes. Often only one of the frequencies on a program will be changed, so the new frequency can be determined by tuning in the other frequencies and listening for the announcement of the frequencies being used. Reference to a publication listing the latest frequency changes, such as the World Radio Handbook Bulletin (issued fortnightly) or a monthly short-wave listeners publication issued in your country, is also helpful.

Interference: Due to the present crowded condition of the medium and short wave broadcasting bands, interference may be encountered from other stations operating on the same or closely adjacent frequency. In addition to interference from other broadcast stations, there may also be interference from "jammers", which transmit a variety of noises in an attempt to prevent certain foreign broadcasts from being heard in the country operating the jammers. When interference is encountered, try another of the listed or announced frequencies, if several are in use, or try a broadcast at another time.

Reception from Hard-to-Hear Countries: If you wish to hear a station or program from a particular country, refer to the listing from that country, determining first whether it has any broadcasts beamed toward your area or adjacent areas, if not, refer to the frequency, time and power listing to determine where and when reception might be possible. Also, note the bands and times when stations in other countries in that part of the world are audible. It is possible to hear many far distant stations, even if they do not beam programs to your area, by listening when the propagation and clearness of channel conditions are favorable.

Verification by QSL-cards: As indicated in the program listings for the various countries, many stations are interested in receiving reports from listeners about their transmissions. These stations acknowledge reports by sending listeners a QSL card (verification) or letter. Most **international** broadcasting stations do not require enclosure of return postage and will reply with a QSL card or letter. **Domestic** broadcasting stations do not normally request reports from foreign listeners, so return postage should be sent with reports to these stations. Return postage should be sent in the form of an International Reply Coupon, obtainable at post offices in most countries. Reports should be sent to the station address given in the country listings. They can be written in English in most cases, but Spanish is preferred by South and Central American stations.

Reception reports are useful to radio engineers in selecting the most suitable frequencies for broadcasts beamed to your area. Reports are preferred in the SINPO code, which is as follows:

S (Signal Strength)	I (Interference)	N (Noise)	P (Propagation Disturb.	O (Overall Merit)
5 excellent	5 nil	5 nil	5 nil	5 excellent
4 good	4 slight	4 slight	4 slight	4 good
3 fair	3 moderate	3 moderate	3 moderate	3 fair
2 poor	2 severe	2 severe	2 severe	2 poor
1 barely aud.	1 extreme	1 extreme	1 extreme	1 unusable

Example: SINPO 55445 means excellent strength, no interference, slight atmospheric noise, slight propagation disturbance, excellent overall merit.

The publication "How to listen to the world" includes information about how to write a report to the stations, in the different languages. See page 04.

In June 1963 we shall issue a summer-supplement to the 1963 edition of the WRTH that will bring the information in your WRTH 63 right up to the minute, including all the summer schedules of the major short-wave stations and a complete up-to date table of short-wave stations

Price: $ 1,50, £ 0/11/0, DM 6,00 Da. Kr. 10,00, Sw. Kr. 7,50

If ordering the 1964 edition of the WRTH and the Summer-Supplement 1963 or 1964 we offer you 10 % discount.

Scotch® BRAND Video Tape..... Scotch® BRAND Magnetic Tape

Since 1956—when CBS pioneered the use of video tape in television broadcasting—"Scotch" Brand has been the standard of the industry around the world! First choice for reliability.

Best for amateurs, best for professionals. 3M's complete line of magnetic recording tape offers maximum frequency response, greater dynamic range, excellent uniformity and low noise level.

For more information about "SCOTCH" Brand Video or Magnetic Tapes, write: 3M, Minnesota Mining & Manufacturing Co., Box 3800, St. Paul 1, Minnesota

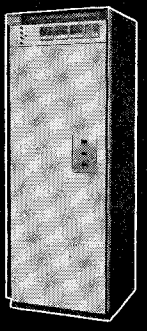
ITA Quality MEANS DEPENDABILITY

1 kw FM TRANSMITTER

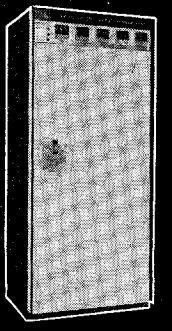


FM's Best 1 KW Buy!

Specially designed for multiplex and stereo broadcasting, this compact unit uses ITA's phase-modulated FM exciter for stability and dependability. Requires only two tube types for simple, economical maintenance. Remote control is extremely practical . . . very few adjustments required. Offers these features: • Stable Grounded Grid PA • Self-neutralized • Semi-conductor Power Supplies • It's value packed!

ITA Quality MEANS UNIQUE ADVANTAGES

1 kw AM TRANSMITTER

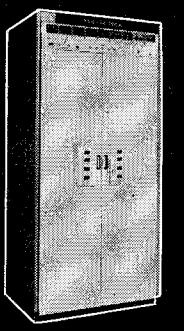


AM's Best 1 KW Buy!

Only ITA offers single control operation . . . solid state rectifiers . . . regulated filament and plate power supplies. PLUS all these features: Remote Control Provisions • Automatic Recycling • Built-in Dummy Load • Only 3 Tube Types • It's value packed!

ITA Quality HIGH EFFICIENCY

5 kw AM TRANSMITTER



AM's Best 5 KW Buy!

The unique PA circuit in ITA's 5 kw AM transmitter operates with about 90% efficiency. Only five tube types used and total tube complement is nine. Makes maintenance simple and economical. Check these advantages: • Solid State Rectifiers • Conelrad and Remote Control Provisions • Power Cutback to 1 kw • Automatic Recycling • It's value packed!

SOLAR ACTIVITY IN 1963

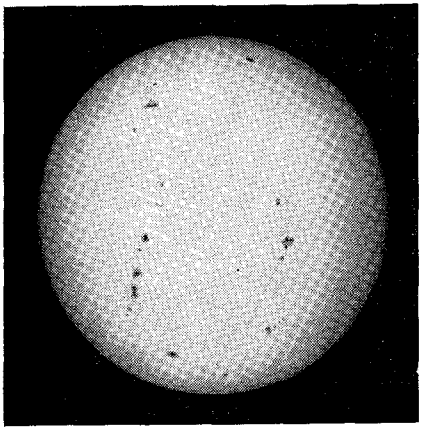
by Prof. Dr. M. Waldmeier

Since 1957, when the sunspot-activity reached its maximum, it has been steadily decreasing. The sunspot-number, which amounted to 190 in 1957, dropped to 185 in 1958, to 159 in 1959, to 112 in 1960, and to 54 in 1961. From 1960 to 1961 a particularly strong decrease of the spot-activity was recorded and – though slowed down – it continued in 1962 and will last also during 1963. For 1962 we predicted a drop from 46 at the beginning of the year to 28 at the end. Actually the smoothed sunspot-number came to 47 at the beginning of 1962, whereas that for the end of the year cannot be determined until the middle of 1963.

Occasionally still larger spots may occur, but on the whole the solar activity will be low and on many days the sun will be without spots at all. The smoothed sunspot-numbers probably will decrease from about 28 at the beginning to about 15 at the end of the year. Yet, the minimum of solar activity seems to be reached in 1964/65 only.

Conditions of short wave transmissions will be similar to those observed in the years 1931, 1942/43 and 1952/53 and will be only slightly different from sunspot-minimum-conditions (1933, 1944, 1954). This means that the ionizing radiation from the sun as well as the ionization in the ionosphere will be weak. Therefore critical frequencies will be low and relatively long waves have to be used.

As in the past years the Swiss Shortwave Service emits regularly the daily relative-numbers for the expired month as well as predictions for the coming six months. The present emission-time-table is as follows below.



Photograph of the sun taken during last sunspot-maximum

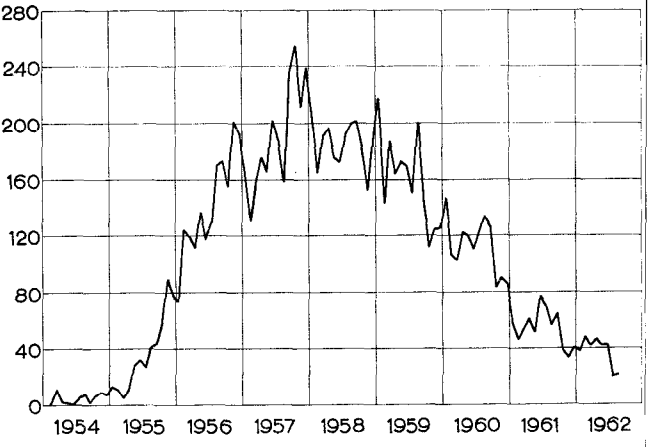


Diagram of the sunspot-relative-numbers 1954-1962

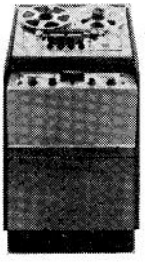
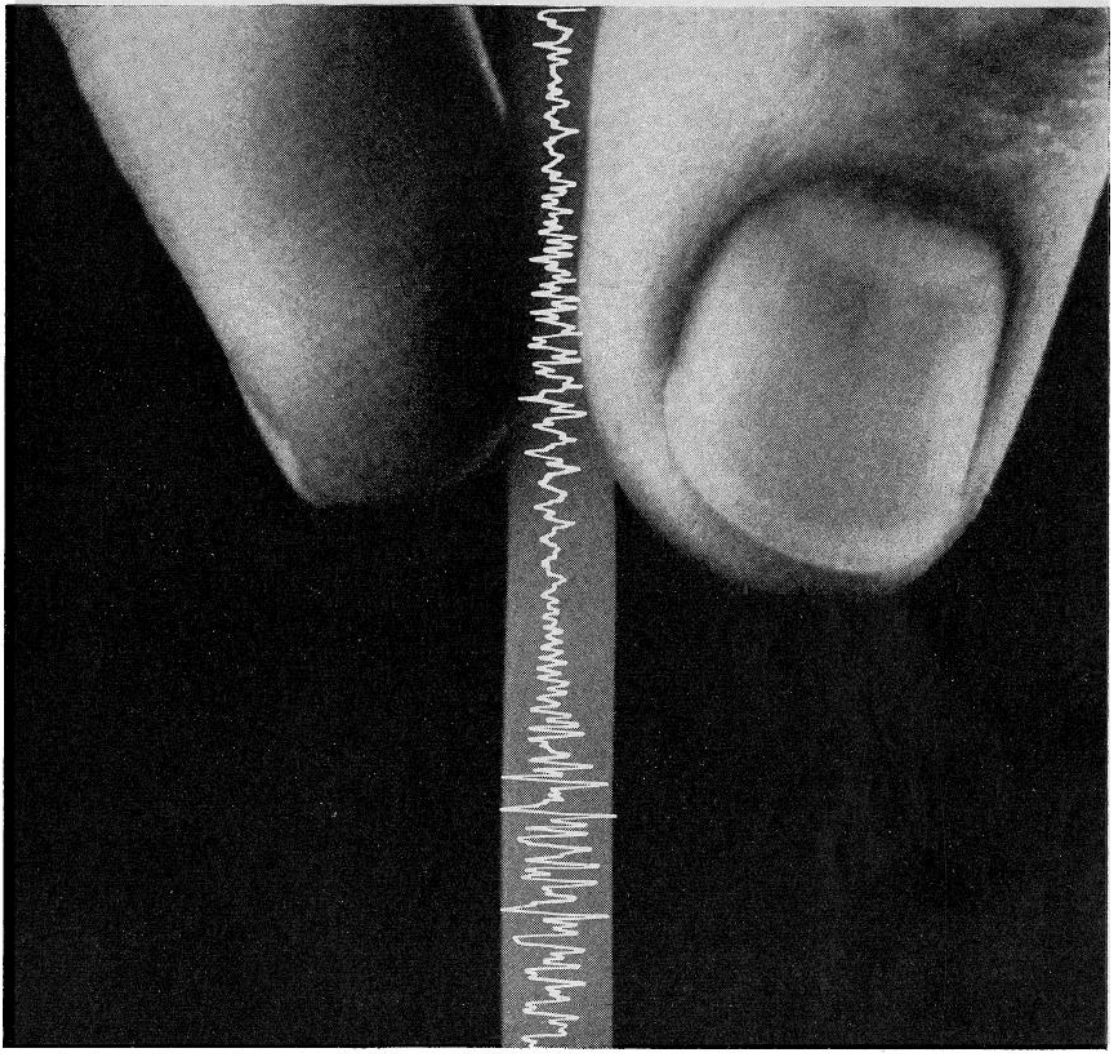
What professional recorders have the world's most reliable tape transports? AMPEX 350 Line

Take a close look at the underside of the Ampex 350 tape transport above. Notice its engineering simplicity. Only five rotating parts. Fewer parts : fewer adjustments. This simplified design ensures thousands of operating hours with minimum maintenance. Do you want proof ? Visit any one of the 5000 broadcast and recording studio installations that now rely on this transport. It is found on all Ampex 350 Line audio recorders — available in over 125 models to fit every world-wide recording need. There is the Universal 351 series of recorder-reproducers with switchable NAB/CCIR equalization. The Universal 352 series for monaural or stereo playback only. And there is the 354 series of stereo recorder-reproducers with two channels of electronics in one convenient package. All models have been designed for maximum dependability, ease of operation and maintenance. All give you the high-quality professional performance you would expect from the only company able to provide recorders and tape for every application : Ampex International S. A., Pérolles 2, Fribourg, Switzerland. Sales offices and franchised dealers throughout the world.



AMPEX



What professional recording tape now offers a new standard of performance? AMPEX 600.

Ampex engineers are never content with present standards. They are always trying to improve what sometimes seems un-improvable. Now they have been at work on the Ampex 600 Series Professional Recording Tape. And they've improved it so much we felt we should call it the new Ampex 600. This 600 Series now offers better high frequency response characteristics. And because an exclusive Ferro-Sheen process makes the tape smooth, the first play and the one-hundredth have the same response characteristics curve. It gives you the kind of reliable performance you expect from Ampex recording equipment. Try this improved 600 Series and see. It's made in the same rigidly controlled clean-room atmosphere as precision computer and instrumentation tapes. It's from the only company providing tape and recorders for every application : Ampex International S. A., 1, rue des Pilettes, Fribourg, Switzerland. Sales and service engineers throughout the world.

LISTENING ON SHORTWAVES

Tuning – Interference – Choosing a shortwave receiver

The world is going through a phase of rapid technical development in the field of telecommunication. In most countries television and F.M. radio have become popular and efficient means of bringing the wonders of sight and sound into the home. Shortwave radio, however, is still unrivalled when it comes to broadcasting over very long distances, and though it demands more trouble and patience of the listener, its possibilities give rich rewards. The whole world is available to you if you know how to get the best reception.

We assume, of course, that your radio set has a shortwave band. As with every article of use a radio set needs regular care. We are apt to neglect our sets because they go on functioning, but for shortwave reception it is essential to have the set tested and trimmed once in three years. Trimming increases the sensitivity of the set, especially on the shortwave bands.

An aerial is another "must" for listening on shortwave. An outside aerial gives the best results, but otherwise (even if you have a built-in aerial) stick a piece of wire, about fifteen feet long, in the aerial connection at the back of your set, and connect the other end with, say, your (metal) curtain rod. If you live in a home built of reinforced concrete an outside aerial is indispensable. You can, however, make shift with a rod-aerial, which can be screwed to the window-frame outside.

Reception from broadcasting stations overseas cannot be as stable and reliable as that of a local broadcasting service. Because of the considerable distances involved, a service for listeners in countries other than the one from which the transmissions originate cannot employ the same methods as are used for a domestic service.

Signals carrying Home broadcasting programmes are normally radiated around the immediate area by ground wave on VHF, medium waves or long waves, whilst signals carrying overseas programmes are mostly transmitted to the distant audiences on short waves by way of the ionosphere.

The ionosphere consists of layers of ionised air varying in height from around 70 to 500 km. above the earth's surface. The signals are projected into the ionosphere which reflects them back to earth again. Such signals must be of suitable wavelength and correctly beamed into the appropriate refracting zone of the ionosphere to enable them to return to earth in the selected listening area.

The condition of the ionosphere, that is to say the effective height and intensity of the various layers, depends mainly upon radiations from the sun; therefore, ionospheric changes take place according to the time of day, to the season of the year and to the cycle of solar activity. It is possible to predict these variations to some extent (see page 32) although to forecast ionospheric disturbances, which can be sudden and severe, is much more difficult.

The principal causes of variable reception are changing propagation conditions. Irregularities in the ionosphere often mean that only weak signals can reach the service area. Every effort is made to overcome this by using the most suitable frequencies and by projecting the signals so as to use the best modes of propagation. The choice is based on theoretical prediction and practical knowledge resulting from long experience. However, the journey along the path from the transmitter to your receiver is a perilous one, and when signals are weakened by unfavourable conditions they become more vulnerable to interference of all kinds.

Tuning in on shortwave requires a little practice. Most shortwave stations operate on the following wavebands: 49, 31, 25, 19, 16, 13, and 11 metres. The corresponding frequency-bands are 6, 9, 12, 15, 18, 21, and 25 megacycles per second.

First make sure your set is switched on correctly to S.W. (shortwave). The dial gives either the wave-bands or the frequency-bands (sometimes both). Turn the knob until the indicator is on the required wave-band. You will then have to move the indicator about a little to the left or right. There are more broadcasting stations operating on the same wave-band, so it is a matter of trying until you can identify the s.w. station. If the frequencies are given on your set it makes it easier to find it. Once you have found the station it will be as well to mark the spot on the dial, so that you will not have difficulty in finding it again. It is important to remember that it takes about fifteen minutes for a radio set to get properly warmed up, unless it happens to be an all-transistor set. It is even more important to remember the old maxim: if at first you don't succeed, *try, try, try again!*

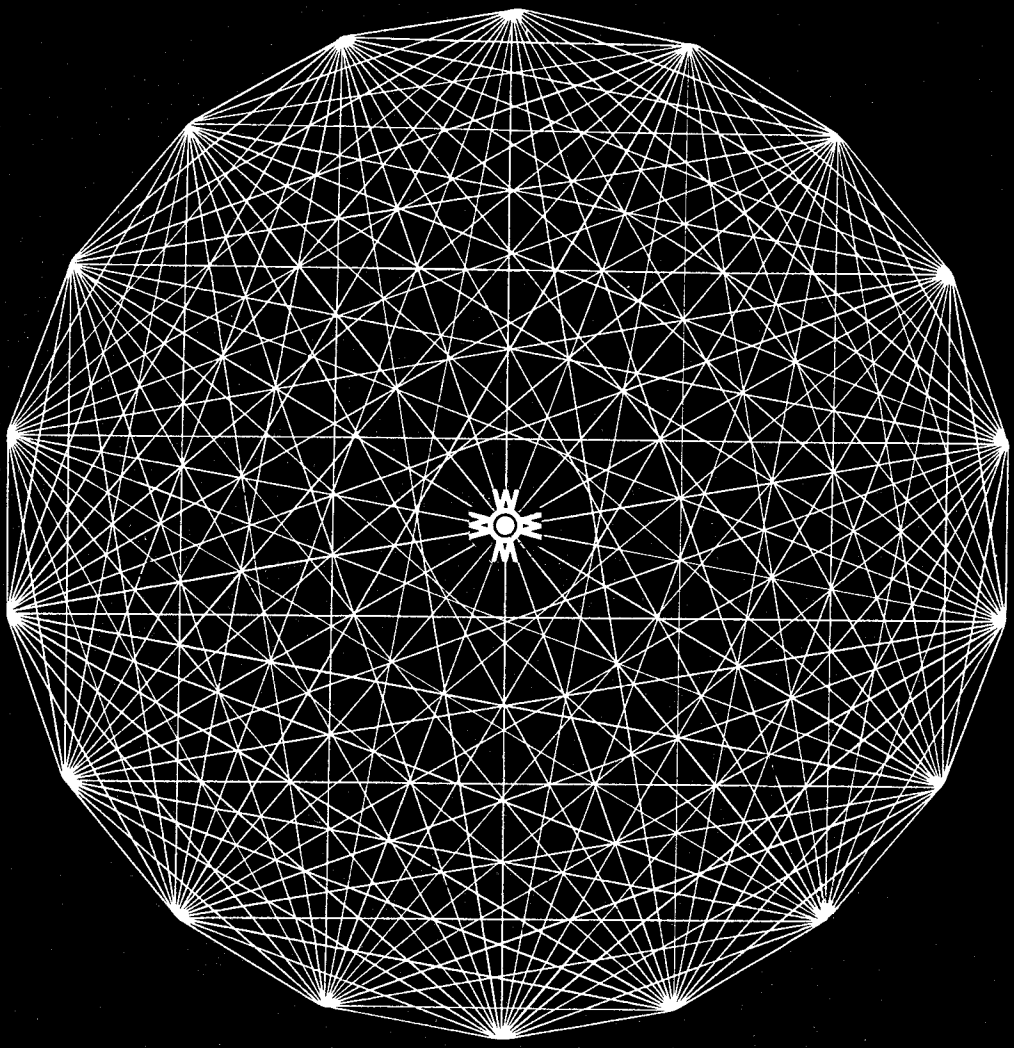
Interferences

Adjacent and Co-channel Interference.

This kind of interference is one reason why listeners may, at times, find that better reception can be obtained on a frequency other than the one advertised for their particular area. Although considerable liaison is carried out on an international basis to avoid interference from the signals of one broadcasting organisation to those of another, the demand for channels in the short wavebands in most use at any given time is much greater than the number available. It often occurs that when a new Frequency Schedule is introduced, signals radiated by other broadcasting organisations appear on the newly introduced frequencies, causing severe interference. In many cases this is quite unintentional and the frequency of one or other of the broadcasting organisations have to be changed again in order to avoid mutual interference. Furthermore, a substantial proportion of signals are subject to deliberate jamming nowadays, particularly at certain peak broadcasting times, and this jamming has the effect of not only degrading over wide areas the signals for which it is intended, but also of affecting signals in the neighbourhood of the jammed wavelengths. Thus there are times when it is difficult to find channels in the appropriate wavebands which are completely free of interference.

Second Channel Interference.

Most broadcast receivers incorporate a "superheterodyne" circuit arrangement. This implies the use of a "local" oscillator in the receiver which tunes in step with the frequency (or wavelength) received as indicated by the pointer on the tuning dial; this "local" (i.e. internal) oscillator is designed to generate a waveform of similar



ANYWHERE, EVERYWHERE

News and Entertainment from anywhere in the world broadcast to people everywhere in the world by the only advertiser-supported International Shortwave Radio Station in the United States.
Worldwide Broadcasting, 4 W. 58th St., New York City

WRUL

strength to the one which is being received, but separated from it by a frequency which remains practically constant. The original signal frequency is mixed with the "local" oscillator frequency and the difference (known as the "Intermediate Frequency") is selected for further amplification.

This Intermediate Frequency (usually of the order of 465 kc/s in broadcast receivers) is fed to one or more fixed-tuned I.F. amplifying stages with the object of improving both the sensitivity and the selectivity of the receiver.

The outstanding advantage of the superheterodyne principle is that selectivity and amplification can be achieved more efficiently and economically at the Intermediate Frequency than at the signal frequencies in the broadcast bands.

There are, however, always two frequencies which, when mixed with a given internal oscillator frequency, will produce the Intermediate Frequency. For example, in a receiver with an I.F. of 465 kc/s, the oscillator may be designed to generate 9535 kc/s when a signal of 10 Mc/s is being received:

1st Signal Frequency	10.000 kc/s
Oscillator Frequency	9.535 kc/s
Intermediate Frequency	465 kc/s

But this Intermediate Frequency will also be produced by a signal of 9070 kc/s:

Oscillator Frequency	9.535 kc/s
2nd Signal Frequency	9.070 kc/s
Intermediate Frequency	465 kc/s

Thus, in the above example, two signals (10.000 kc/s and 9.070 kc/s) may both be receivable at a single setting of the tuning dial. One will be the "wanted" signal whilst the other will be what is called the "second channel"; it is this "second channel" which often produces interference on what would otherwise be a clear signal.

One or more tuned radio-frequency amplifying stages in a superheterodyne receiver can provide sufficient R.F. selectivity to ensure that the strength of the "second channel" is reduced below audibility.

Local Interference.

There may be sources of electrical interference in the neighbourhood which can spoil and even obliterate all radio signals throughout or over a considerable part of the tuning range of a broadcast receiver. This kind of interference is often known as "man-made noise", as distinct from that caused by natural phenomena, and can result from electric trains, trams, workshop machinery, fans, hair-dryers, refrigerators, motor-car ignition systems and almost any kind of electrically operated industrial and domestic equipment.

The ideal method of eliminating locally generated interference is to fit suppressors at the source. This often presents difficulties because it is first necessary to locate all the offending electrical equipment; however, there are authorities in most European countries delegated to investigate radio and television interference and who possess the necessary apparatus to trace the causes.

It is usually found that the signal strength required to overcome the general level of "man-made noise" in populous industrial districts is much greater than in the suburbs but, irrespective of local conditions, it is always advisable to use a properly designed outside aerial. Local "man-made noise" can usually be reduced by arranging the receiving aerial in such a way that it picks up the required radio signals at the best possible strength with the least amount of interference. The aerial should be erected as far as possible away from the sources of interference and as high as the circumstances permit.

In order to prevent the "lead-in" from the aerial to the receiver picking up the local interference, co-axial cable can be used. The aerial is connected to the inner lead of the top end of the "lead-in" cable, the other end of inner lead being connected to the aerial terminal on the receiver. The sheath of metal braid should be earthed at the receiver end. For dipole aerials, two co-axial cables can be used or, alternatively, the inner lead can be connected to one element (or arm) and the sheath to the other. Cable with two inner leads is sometimes available, thus one lead can be connected to each element. Some losses due to mismatching of the cable to the aerial and to the receiver are likely; discerning listeners may like to experiment with matching transformers. Advice on this may be sought from a local radio expert.

Choosing Wavelengths.

Listeners should always tune to the frequency which is advertised for the particular area in which they live because the transmissions on these frequencies are engineered in such a way as to provide the strongest and best results in that area under normal conditions. The signals have to be projected on the correct vertical and horizontal beams of the appropriate width and on the most suitable frequencies; thus they can reach the refracting zone of the ionosphere to return to earth again with the best possible strength at the listener's aerial. However, as conditions vary to such an extent from day to day and even from hour to hour, listeners may have difficulty in receiving the recommended frequency or the one on which they normally listen, so it is always advisable to try other frequencies which are available at the time.

Frequencies have to be revised at frequent intervals not only to keep pace with the seasonal changes in propagation but also to avoid interference. Frequency Schedules are compiled on the basis of both theoretical and practical considerations, see page 60: Table of the most suitable metrebands.

Choosing a Receiver

We must be quite impartial over the products of individual manufacturers and it is not possible, therefore, to recommend or offer advice here on any specific makes or models. The general advice which follows is intended to be helpful in the selection of a suitable receiver.

Waveband Coverage:

Perhaps the first consideration should be given to the wavebands to which the receiver should tune. As we have said earlier, only frequencies which are suitable for the prevailing conditions can provide the best results and it is, therefore, desirable that the tuning arrangements in the receiver should include all the wavebands which are likely to be required in listening at your location. THE WORLD'S SMALLEST AND LIGHTEST 5 INCHES PICTURE TUBE ALL TRANSISTORIZED, TRULY PERSONAL MICRO TV MODEL 5-303

Weighs only 8 lbs

Miniature television has reached new heights with Sony's new Micro TV Model 5-303 portable. It's a finger-tip television set which can be carried anywhere at anytime for a miracle of enjoyments.

SPECIFICATIONS

Dimensions :	7 5/8" (W) × 4 1/4" (H) × 7 1/4" (D)
Weight :	8 lbs.
Power Requirements :	AC and DC 12V.
Antenna System :	Built-in Telescopic Antenna Jack for External Antenna
Speaker :	3" Diameter
Circuit :	AGC : Pulse-operated Automatic Gain Control System
	AFC : Balanced Type Automatic Horizontal Frequency Control System
	ANS : Automatic Synchro-noise Suppressor
Transistors :	24 (5 Silicon-including 3 Epitaxial) (19 Germanium)
Diodes :	20
Picture Tube :	5", 70° Deflection, Aluminized Screen
Earphone Jacks :	2
Maximum Sensitivity :	10 μV

I-0007

of darkness during the minimum phases of the cycle of solar activity, a large part of Europe is dependent for shortwave reception upon the 75 metre (4 Mc s) band, the longest shortwave band used for broadcasting. Although medium waves may sometimes provide an alternative, the medium wave band is subject to so much congestion and interference that listening to distant stations is often unsatisfactory. The waveband coverage of the receiver should therefore include the 75 metre band, bearing in mind that it will be required only in winter during part of the solar cycle, but that there will be occasions when it is likely to be essential for satisfactory results.

The 49, 41, 31, and 25 metre bands (6, 7, 9, and 11 Mc's respectively) are included in almost every receiver with shortwave tuning. They will all be needed sooner or later as conditions demand.

The 19 metre band (15 Mc's) and possibly also the 16 metre band (17 Mc s) may well be needed during the maximum phases of the cycle of solar activity and will be found a great asset in obtaining good reception, particularly in daylight. The 13 and 11 metre bands (21 and 26 Mc s respectively) will not be required for listening in the nearer countries, but they will be essential for receiving transmissions from more distant sources. Receivers which include these shorter shortwave bands enable far distant stations, almost all over the world, to be well received when conditions permit.

Tuning and Band-spread.

Tuning on shortwaves, particularly on the higher frequencies, can require considerable patience and skill. There may be many stations within a very small compass of the dial and any backlash in the tuning mechanism can be most aggravating. The latter should, therefore, be checked to ensure that the tuning as well as the pointer responds accurately to reversals of the tuning knob.

In recent years, tuning has been made much easier by what is called "band-spreading". This is a device—usually electrical, although occasionally mechanical—whereby some or all of the shortwave broadcasting bands are extended to occupy the full length of the tuning scale. For example, the 13 metre band which covers from 21450 to 21750 kilocycles, or 13.99 to 13.79 metres, may be extended to occupy a scale six or more inches in length. Bandspreading simplifies tuning considerably, and all wavebands shorter than 31 metres should preferably be bandspread. Tuning is made much easier in the face of interference of any kind, including jamming.

The Tuned Radio-Frequency Amplifying Stage.

The majority of domestic receivers do not have a tuned radiofrequency amplifier in front of the mixer stage; nevertheless, it is important that such an amplifier be incorporated. The R.F. amplifying stage fulfils two very important functions. First, the sensitivity of the receiver itself tends to decrease the higher the frequency, and above about 15 Mc s the signal may be poor in relation to the unwanted noises generated in the receiver. The addition of an R.F. amplifying stage improves the signal-to-noise ration considerably, particularly on the shorter wavebands.

Secondly, the selectivity of the receiver is improved and what is known as "second channel" or "image" interference is reduced. This is often characterised by an annoying whistle of constantly changing note together with unwanted morse signals or programme modulation: alternatively, it may take the form of noise interference. Much of the interference experienced in the broadcasting bands is due to "image" effects, and the R.F. amplifying stage helps to eliminate or reduce them.

The radio-frequency and the intermediate frequency stages are more important for shortwave listening than the audio-frequency stages which supply the power for the loudspeaker and largely determine the quality and maximum volume. Push-pull output stages and loudspeakers with wide audio-frequency range are excellent items in themselves, especially for local station listening or gramophone reproduction, but for shortwave reception it is the sensitivity and selectivity of the earlier stages which count most.

Automatic Gain Control.

Practically all modern receivers are equipped with automatic gain control circuits (A.G.C.) which help to combat changes in signal strength by maintaining the output from the loudspeaker at a reasonably constant level. Unfortunately, this system makes tuning slightly more difficult, since the action of the A.G.C. tends to mask slight mistuning of the receiver with a consequent increase in distortion. A useful, but not essential, refinement is a tuning indicator or "magic eye" which enables one to tune in to a signal with a much greater degree of accuracy.

A further refinement which can be extremely useful is the fitting of terminals or sockets on the aerial panel at the back of the receiver to allow connection to a "dipole" aerial.

To summarise the more desirable items in the receiver specification, the waveband coverage is most important whilst at least one tuned radiofrequency amplifying stage is desirable if reasonably interference-free results are to be obtained. Bandspread tuning is a valuable asset, since it enables crowded stations to be more easily separated. Powerful automatic gain control is necessary to smooth out large variations in signal strength. Variable selectivity is incorporated in some receivers and can often be used to considerable advantage in overcoming interference.

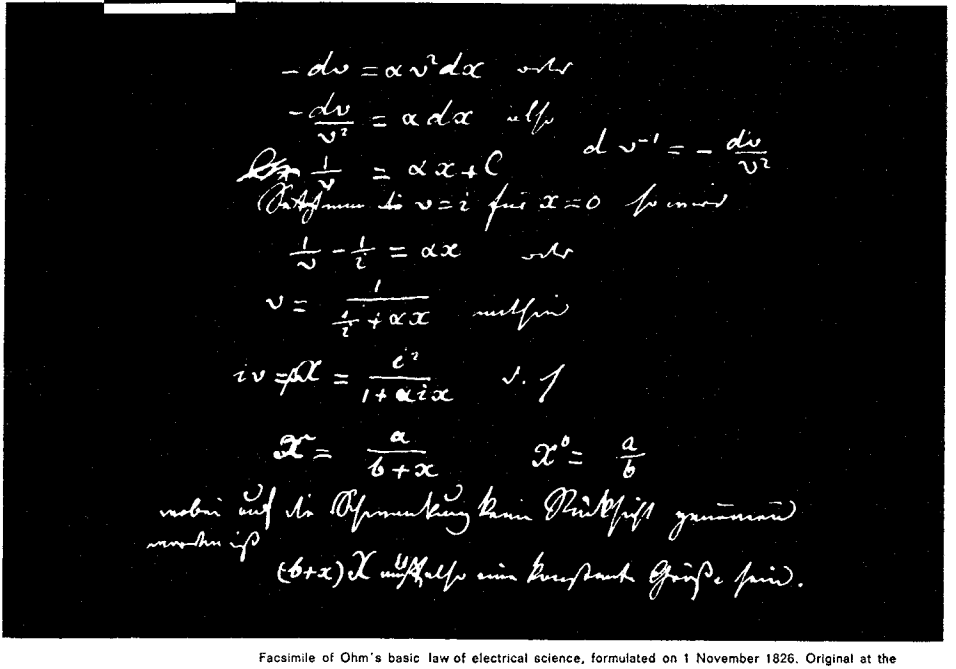
From »Listening to London« and »Radio Nederland«.

We want your help

We wish to get in touch with shortwave enthusiasts in all countries who will cooperate with us for the following purposes:

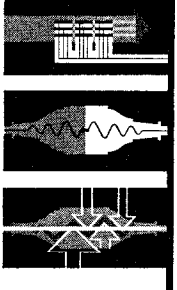
- Help us to create touch between short wave fans in other countries and in your's.
- Help us to spread knowledge of WRTH by, for example, distributing our brochure to interested friends and acquaintances.
- Send us from time to time reports on the results of your listening. If you are able to send us reports regularly (monthly) we will send you our World Radio Bulletin every fortnight.
- Send us your criticism and wishes about the contents of WRTH — your own and those of your friends. Write to Lund Johansen, Lindorfsallé 1, Hellerup, Denmark.

TUCHEL-KONTAKT



Facsimile of Ohm's basic law of electrical science, formulated on 1 November 1826. Original at the Deutsches Museum, Munich.

Electric connectors, so necessary for the operation of electronic apparatus, are developed under the same stringent rules as any other precision component. The **laws of nature** are the foundation of such development, and to harness them efficiently for exploitation can be achieved only by consequently adhering to the principles governing the resulting hardware.



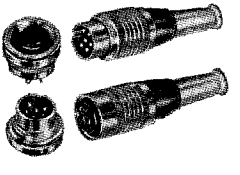
Low Voltage Drop

Low Constant Contact Resistance

Long Life

High Vibration Resistance

Imperviousness to Environment



6 contact miniature connector with coupling nut
T 3400/1 T 3401/1 T 3402 T 3403

. . . are the demands of modern practice. These requirements are fully met by means of a large number of contact points connected in parallel, using the whole engagement depth of the mated contact elements.

THE TK DESIGN MEANS SAFETY

AERIALS

Good reception does not depend upon the receiver alone —the sounds which it reproduces must depend upon the quality of the signal which is fed into it. A large and expensive receiver may, therefore, not give good results unless it is connected to an efficient aerial.

Good insulation from earth

In radio technology, the word "earth" is used in its broadest sense. Trees, bushes and even houses are "earth", particularly in wet weather. A waterpipe makes an excellent earth, because the supply pipes often lie in water under the soil

A good insulation from earth, therefore, means keeping the aerial as far away as possible from trees, gutters etc. When lashing the ends of an aerial to a tree, chimneystack, etc., they must be isolated by means of ceramic, glass or plastic insulators.

Material

Because the aerial has to remain in the open air, it is subject to corrosion. The effect of high winds also plays a role in the selection of the most suitable material. Naturally, only wire having a high conductivity should be used. Practice has shown that silicon-bronze wire fulfills the requirement adequately, but there are several other copper alloys which are suitable for the purpose. The ordinary soft copper wire should not be used, as it will almost certainly break in a high wind.

Stranded copper wire (Litz wire) can also be used, as well as ordinary insulated domestic wire. The insulation does not have any unfavourable influence on reception and, in addition, protects the wire from weather influences. So don't remove it!

Matching the aerial to your Receiver

Owing to the considerable technical differences in radio receivers, it is not possible to give a general rule for matching. It is obvious that maximum results will be obtained by using an aerial of the same impedance, as the loss of signals will then be limited to a minimum.

Height

An aerial should be erected as high as circumstances permit. The greater the height the stronger is the incoming signal and the weaker is the factor of interference from such sources as ignition systems, refrigerators and so on. The height of the aerial is always measured down to the nearest "earth".

The lead-in

The lead-in to the receiver must be well insulated, and its length must be kept to a minimum. It should not be laid less than 4 inches (10 centimetres) from any electrical supply cable. The plug used at the point of connection to the receiver must make good contact with the aerial input socket.

Various Types of aerial

1. VERTICAL ROD:

Equally sensitive in all directions and will work satisfactorily on most broadcast bands. The rod should be about 5 metres in height, mounted as high as possible above the ground.

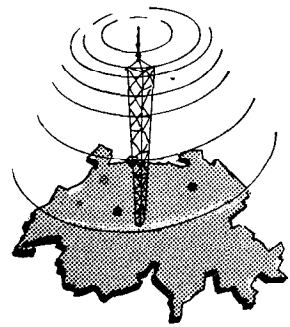
THE PROJECTED EUROPEAN PROTESTANT RADIO STATION IN SWITZERLAND BROADCASTING THE GOSPEL IN:

Arabic, Bulgarian, Czech-Slovak, Danish, Dutch, English, Esperanto, Finnish, French, German, Hebrew, Hungarian, Italian, Norwegian, Polish, Portuguese, Rumanian, Russian, Slovene, Spanish, Swedish.

- It is intended to broadcast 8 hours daily over several wave bands in sufficient power to cover all European countries and beyond.
- Leaders of State Churches and Free Evangelical Churches in 58 nations have given their support to the project.
- The Station will be under the supervision of an Interdenominational European Committee.



Details regarding this project are issued in "epi news service" (German, French, Italian, Dutch and Spanish editions are also available). For further information and FREE Radio Brochure, write to:

E. P. I. – P. O. Box 392, B E R N E 2 (Switzerland).

Shielded cable is recommended for the lead-in to the receiver, the outer sheath being earthed at the receiver end only. If bare wire is used, insulators must be employed at all points where the lead-in comes in contact with the building. It is advisable to use them, even when insulated wire is used. It is a wise precaution to fit a lightning arrestor with this and all types of outside aerials.

2. INVERTED "L" AERIAL:
Almost equally sensitive in all directions and will work satisfactorily on most wavelengths used for broadcasting. Can be 10 to 30 m. in length, suspended as high as possible. Shielded cable may be used for the lead-in if there is local interference.

3. "T" AERIAL:
There is little difference between the "T" and inverted "L", the choice depending almost entirely upon the local layout and facilities for suspension.

4. HORISONTAL DIPOLE:
Mainly sensitive to signals arriving at right angles to its length. Thus interference from signals from other directions may be reduced. The length of the aerial is critical in that each half should be approximately equal to one quarter of the wavelength you wish to receive. Thus, for the 31-metre band, for example, each half should be about 7¾ m. long. Its performance is comparatively poor on wavebands for which it is not designed. Furthermore, it will not operate properly unless the receiver input is suitable. Some receivers have this facility, but many will need modification. An independent earth connection should be made to the receiver, but lightning arrestors connected between each lead and earth are recommended.

5. INVERTED "V" AERIAL:
This aerial is also strongly directional and is mainly sensitive to signals coming from the direction in which the arrow points. The length of each of the two limbs should be half a wavelength longer than the distance A. Typical dimensions for an aerial suitable for 11 to 19 m. are:

Mast 20 m.
Length (L) 25 m. R = 400 ohms
Half base line (A) 15 m.

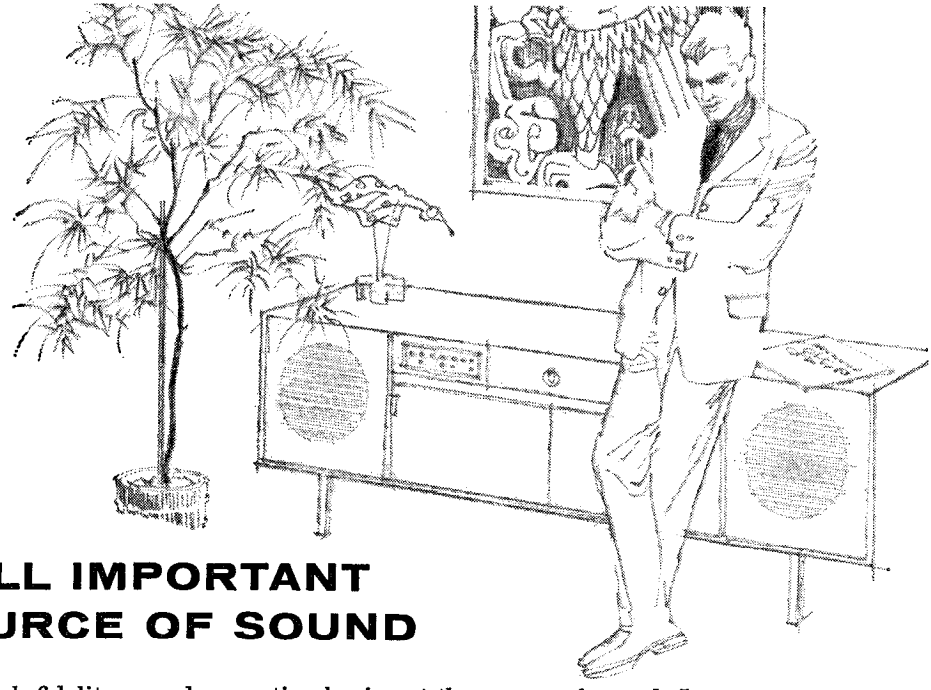
Such an aerial would be satisfactory over the other short-wave bands. The receiver should be separately earthed.

In conclusion, here are some points which may well be of importance.

External interference experienced with aerials having a single lead-in can be reduced by the use of a co-axial cable for the lead-in. The centre conductor is connected to the input of the receiver and the shield to earth. When purchasing co-axial cable for this purpose, make sure that it possesses the lowest possible capacity per foot and also keep the length to a minimum.

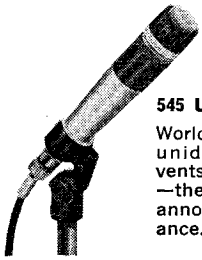
Interference from the mains supply, such as that caused by fluorescent lamps, washing machines and other electric apparatus, can best be reduced by the use of so-called "interference suppressors" which are connected directly to the source of the interference. Your radio dealer will be pleased to advise you further in this matter.

From "Listening to London"



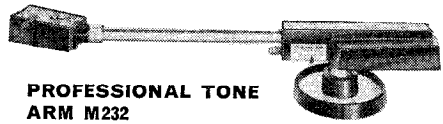
THE ALL IMPORTANT SOURCE OF SOUND

True high fidelity sound recreation begins at the *source* of sound. Just as a camera is no better than its lens, a phonograph is no better than its cartridge . . . a sound system is no better than its microphone. The cartridge must translate record groove undulations into precise electrical impulses—and the microphone must interpret speech and music—without addition, subtraction or distortion of the most subtle nuances. Finest quality components at the source result in an amazing realism and accuracy of sound that makes listening to true high fidelity a genuinely rewarding experience.



545 UNIDYNE III

World's most compact, probe-type, unidirectional microphone. Prevents over-emphasis of bass tones —the perfect solution to halls with annoying resonances. Dual impedance. 50-15,000 cps response.



PROFESSIONAL TONE ARM M232

For use with any quality cartridge . . . mono or stereo. Floats with needle over the record . . . without "drag" or "skip".

New Improved INTEGRATED TONE ARM AND CARTRIDGE M222

A stereo tone arm with cartridge that recreates sound with astonishing fidelity. Tracks at incredibly light ¾-1½ grams—minimizes record wear. Striking modern design.

55S UNIDYNE II

The most widely used, high quality P.A. system, unidirectional microphone. Ultra-cardioid pick-up pattern suppresses feedback. High-output. Can be used with low-gain systems. 50-15,000 cps.

M33 STERIO DYNETIC

Shure's finest high fidelity cartridge. Tracks stereo recordings at pressures as low as ¾ gram with superb fidelity. Model M77 available for tracking at 3 to 6 grams.

THE WORLD OF RADIO BROADCASTING

By Roger Legge, USA.

Broadcasting stations are assigned specified bands for operation, as follows:

LONG WAVE (Low Frequency)		MEDIUM WAVE (Medium Frequency)	
Kilocycles	Meters	Kilocycles	Meters
150–285	1053–2000	525–1605	187–571

SHORT WAVE
Tropical Broadcasting Bands

Kcs.	Megacycle Band	Meter Band
2300–2495	2	120
3200–3400	3	90
4750–5060	4	60

HIGH FREQUENCY BROADCASTING BANDS

Kcs.	Megacycle Band	Meter Band
3900– 4000	3.9	75
5950– 6200	6	49
7100– 7300	7	41
9500– 9775	9	31
11700–11975	11	25
15100–15450	15	19
17700–17900	17	16
21450–21750	21	13
25600–26100	25	11

Some broadcasting stations operate outside of the assigned bands, mainly near the edges of these bands.

The LONG WAVE BAND (used in Europe) and the MEDIUM WAVE BAND (used worldwide) are used mainly for domestic broadcasting, but are used also for some international broadcasting to adjacent countries. Although long and medium wave station are normally heard only for moderate distances, long distant reception is possible over dark transmission paths, mainly during the fall, winter and spring months in the reception area.

The TROPICAL BROADCASTING BANDS are assigned for use for *domestic* broadcasting in tropical areas, where high atmospheric noise levels limit the service area of medium wave stations. DX reception on these bands is best when the transmission path between the transmitter and receiver is all or mostly in darkness. These bands are used mainly by stations in Latin America, East and West Africa, South and Southeast Asia.

The HIGH FREQUENCY BROADCASTING BANDS, between 3.9 and 26.1 megacycles, are used for both international and domestic broadcasting. These bands are allocated for worldwide use, except that the 3.9 and 7 mc. bands are not allocated for broadcasting in the American area.

Reception conditions on these bands vary according to the time of day and season of the year. Most of the international broadcasting stations make seasonal changes in frequency usage, especially on the first Sunday of March, May, September and November. In addition, frequency and times changes are made at other times during the year, due to interference, change of program times, addition of new transmitters, etc. A large percentage of the domestic broadcasting stations operating in the high frequency bands do not make seasonal frequency changes, but some, particularly the stations in India, Pakistan, USSR and South Africa, do make seasonal shifts.

The *3, 6 and 7 mc. bands* are best for distant reception when the transmission path is all or mostly in darkness, and during fall to spring months in the reception area. Reception at any point is therefore best from the East from shortly before sunset until several hours before dawn, from the West around dawn and several hours prior to that time, and from the North and South at any time during the night hours.

The *9 and 11 mc. bands* also are best for long distant transmission on darkness paths, but reception is possible several hours before and after usable hours on lower bands. For moderate distances, such as within Europe, daytime propagation is satisfactory for 9 and 11 mc. transmissions.

The *15, 17, 21 and 25 mc. bands* are, in general, best during periods of daylight on the transmission path, except that the 15 and 17 mc. bands are open on night paths during the summer months.

With regard to seasonal variation, the best bands for night reception are lower in winter than in summer. The best bands for daylight path reception are higher in winter than in summer

Satisfactory reception of broadcasts from various areas of the world therefore depends considerably on listening on the most suitable bands at the most favorable times of the day (see the table page 50). Application of these principles, together with reference to accurate program and frequency schedules, should enable any listener to hear stations of many countries in all parts of the world.

SMOOTH...

Two of the most hopeless looking problems in sound recording have now been definitely solved. Polished Gevasonor Magnetic Film Type 2.01 puts a stop to the collection of dust and the rapid wear of sound heads

The iron oxide surface of Gevasonor Type 2.01

has a mirror-like polish, and guarantees :

- closest possible contact between film and sound heads, improving uniformity of reproduction ;
- minimum wear of the sound heads, which ensures permanently good high-frequency reproduction ;
- no build up of dust on the face of the sound heads, therefore better recording quality.

Other Gevasonor Magnetic Films :

Type 2.02 : of higher sensitivity than the normal film Type 2.01 (+ 5 decibel) with less distortion (0.5 per cent.) ; used for special work ;

Type 2.21 : 35 mm magnetic film with two tracks ; mostly used at the editing stage of 35 mm film production ;

Type 2.11 : 35 mm magnetic film with clear edges.

SHORT WAVE CONDITIONS DURING 1963

By Stanley Leinwoll, Radio Frequency and Propagation Manager, RFE

DURING 1963, the trend toward decreased sunspot activity which began in April 1958, will continue. Since sunspots directly affect the ionosphere, the importance of decreased solar activity on long distance high frequency radio communications cannot be overlooked.

The ionosphere is an electrified region which exists from 100–500 km above the earth. It has the unique property of being able to reflect radio waves over great distances. The range of frequencies which the ionosphere can reflect depends to a considerable extent on the amount of ultraviolet radiation reaching it from the sun.

The amount of ultraviolet radiation reaching the ionosphere varies significantly, as a result of which the range of frequencies that the ionosphere can reflect changes over a wide range, incl. changes from day to night, from season to season, from one location on the earth to another; in addition, from year-to-year, over an 11 year cycle.

These year-to-year changes are most commonly referred to as the 11-year sunspot cycle, because the number of sunspots appearing on the sun vary from a minimum to a maximum and back to a minimum again during a period which averages slightly above 11 years duration. Since the amount of ultraviolet radiation reaching the ionosphere is directly related to the number of spots appearing on the sun, it is evident that the 11-year sunspot cycle is perhaps the most important factor influencing the characteristics of the ionosphere.

In general, the greater the number of sunspots, the greater the intensity of ultraviolet radiation reaching the ionosphere, and the higher the frequencies the ionosphere can reflect. During 1957–58 more sunspots appeared on the sun than at any previous time. As a result, the range of frequencies the ionosphere could reflect was greater than had ever been observed in the entire history of radio communications. Short wave conditions in the 26, 21, 17, and 15 Mc broadcast bands were better than they had ever previously been, while conditions in the lower bands were relatively poor.

As can be observed from the accompanying illustration, there has been a steady decrease in sunspot activity since 1958. As a result, the higher bands have been losing their value, while the lower bands, 25, 31, 41, 49, meters have been improving steadily.

During 1963, sunspots will continue their downward trend, with the result that the higher bands will continue to deteriorate while the lower bands will become more and more important.

A general summary of expected conditions in 1963:

11 meters: The outlook for this band is not encouraging during 1963. During the years of high sunspot activity, this band was open for longer than at any previous period in the history of radio. Now, it has all but disappeared, with practically no broadcast use being made of it.

13 meters: During the years of maximum sunspot activity this band was best during the daylight hours to most areas of the world during all seasons. On some circuits the band was also open during the evening and nighttime hours. During the summer months of 1963, very limited use of the band is expected over east-west circuits, with some more use being made over circuits into the southern hemisphere.

Fall and Spring should see some improvement, but for openings on east-west paths the winter months will be best.

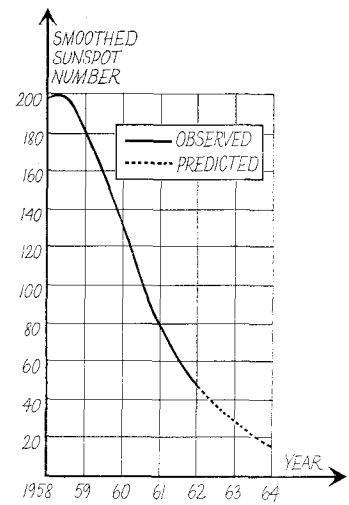
16 meters: Trans-oceanic openings during the daylight hours of the fall, winter, and spring months will be more common than the 13 meter band, and over circuits to and from the southern hemisphere there should be good activity during all seasons of 1963.

19 meters: During the years of high sunspot activity this band was often good *around the clock* during many months. During 1963 this will not be the case, although 19 meters should be the best band for DX during the daytime hours. In the summer the band should be open from shortly after sunrise to several hours after sunset. During the fall and winter months good DX will be possible during the daylight hours, but during the winter months this will be of short duration, since there are relatively few hours of daylight in the northern hemisphere.

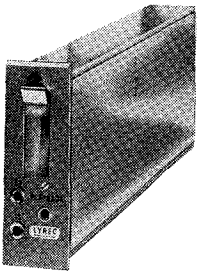
25 and 31 meters: During the winter months of 1963 there will be relatively few openings in an east-west direction after dark, with some activity over circuits between the northern and southern hemisphere. During the summer months, these bands should be fairly good during the evening hours to most parts of the world. During the summer daytime period, openings should occur over shortdistance circuits, to distances up to about 1200 miles.

41 and 49 meters: These will be the best bands for nighttime DX for most of the year, with the possible exception of the summer when 31 meters will also be good. During the winter months, 49 meters will be the most used band, with extreme crowding and heavy interference expected. Since this is the lowest band allocated internationally, many broadcasters will be using it, since it will be the only one propagationally of value.

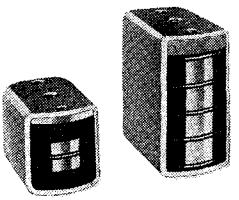
60, 80, and 160 meters: During the winter months, when noise levels are low, these bands will be more useful for DX than at any time since 1955. In addition, some DX is possible during the spring and fall on quiet nights. Some short range openings are also likely during the late afternoon, evening, nighttime, and early morning periods.



Transistorizing your Studios?



Transistorizing Recording- and Playback Amplifiers to match broadcast specification for vacuum tube amplifiers is a tall order. Lyrec has made it and can supply the amplifiers in cassettes as shown above or built together with transistorized auxiliaries (monitors etc.) in any combination for mono and/or stereo application (MS/XY).



The new master-recorder TR31, shown below, with four fully independent tracks on 1" tape is supplied with all transistorized amplifiers, bias generators, and will fill the great demand for a pre-master tape without loss in signal/noise ratio. Please write for details of these products as well as of our new line of magnetic heads for professional recorders and instrumentation recorders up to 16 tracks on 1" tape.

HIMBROS AG, Glarus, Switzerland OR P. O. Box 133/7, Zurich 44, cables: AIRTIMESALES Zurich

TABLE OF THE MOST SUITABLE METRE BANDS, 1963

The table shows the bands that are likely to be best for short wave reception to and from every major area in the world at various times of the day from the period November, 1962 to October, 1963. The above figures should be used as a guide only. Where the band given is not suitable, use the one immediately above or below. To use the tables, first choose the area in which you are located, then for the time desired, slide your finger across the line until you have located the area to which you want to listen, for the proper season. For example, a listener in the European area would best receive the 31 m. b. at 07GMT from the M. E. during the period November 1962 to February 1963.

By *Stanley Leinwoll*, Radio Frequency and Propagation Manager, RFE.

THE LISTENER'S AREA	Local time	Approx. GMT Time	LOCATION OF TRANSMITTING STATION

OF THE WORLD

1. **Bocaranga** – Balafond-instrument.
2. **Radio Nederland Wereldomroep:** A nice cup of tea. Edward Startz Head of the broadcast: The Happy Station.
3. **Radio Japan:** A scene of the broadcast of the "Let's Speak Japanese"; From left to right: Mrs. Rosemary Farrelly, wife of a member of the Australian Embassy in Tokyo. Dr. Matsumoto and Miss Mitsuko Tomobe of the Tokyo Broadcasting Drama Troupe.
4. **Territory of Papua and New Guinea:** Men of the Banz area in the Western Highlands re-enact a traditional tribal ceremony as part of their official welcome to a United Nations visiting mission.
5. **United Nations:** Seen on the presidential rostrum during a General Assembly from left to right: Acting U.N. Secretary General U. Thant, General Assembly President Mongi Slim (Tunisia) and C. V. Narasimhan, U.N. Under-Secretary in charge of General Assembly Affairs.
6. **North Borneo:** Radio Sabah interviews two Beauty Queens.
7. **The Voice of America:** Bill Leonard, host on the VOA's weekly prgr. for radio hams "The Radio Amateurs Notebook" interviews one of the most unusual families in ham radio. Every member of the Alessi family is a licensed radio amateur. Robert – age 6 – is probably the youngest licensed radio amateur in the world.

VISUAL

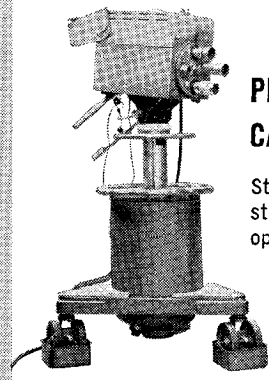
IS THE SINGLE SOURCE IN THE USA FOR

VIDEO / AUDIO EQUIPMENT

EVERY ITEM FOR RADIO AND TELEVISION BROADCASTING

Representing the Leading Manufacturers in America

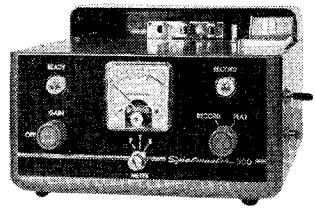
Visual Electronics — technically competent and experienced in all phases of equipment planning is your **single** source for all your broadcast equipment needs.



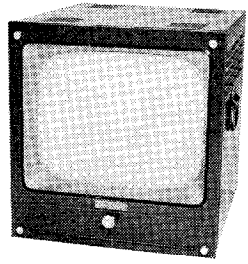
PNEUMATIC-BALANCE CAMERA DOLLY

Standard in major television stations. Smooth, effortless operation at a sensible price.

SPOTMASTER CARTRIDGE TAPE EQUIPMENT



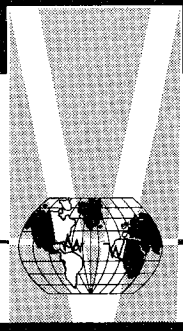
The most popular cartridge tape equipment —Spotmaster—provides new techniques and conveniences in sound programming. Compact units for control room or field use.



CONRAC TV PICTURE MONITOR

Internationally recognized as the practical TV monitor.

Excellent performance, stability and reliability—at a sensible price.



Outstanding broadcasters throughout the world rely on Visual for supply of equipment of a unique nature available from major American Manufacturers.

STANDARD FREQUENCY AND TIMESIGNAL STATIONS

The ordinary short-wave listener soon notices a specialized technical program of tones and time pulses usually received on carrier frequencies of 2.5, 5, 10 or 15 Mc and sometimes on 20 and 25 Mc, if he listens in that part of the spectrum. These signals have many uses in science and technology. They are most useful to the non-specialist in obtaining accurate time, in cheeking the calibration of his radio receiver, and in gaining information on radio propagation conditions. The forecasts of the present and future state of the ionosphere can be quite useful in determining the possibilities of short-wave reception. The forecasts are given by WWV, WWVH and JJY for certain parts of the globe.

R. STATION WWV AND WWVH (Go.)

ADDR.: National Bureau of Standards, Boulder, Colorado, USA – Station WWV, Greenbolt, Md. WWVH: Box 578, Puunene, Hawaii. **L.P.:** Chief Radio Broadcast Sce's: A. H. Morgan. Chief WWV: F. Sera. Chief WWVH: S. Katahara.

Standard Radio Frequencies: WWV: 2500 kc 1 kW – 5000 kc 8 kW – 10000 kc 9 kW – 15000 kc 9 kW – 20000 kc 1 kW – 25000 kc 0.1 kW. The Broadcasts are continuous, night and day, exc. for silent period. 45–49 min's past each hour.

WWVH: 5000 kc 2 kW – 10000 kc 2 kW – 15000 kc 2 kW. Continuous exc. for silent period from 15 minutes to 19 minutes past each hour and from 19.00–19.34 daily.

Time signals: The audio frequencies are interrupted at precisely 3 min.s before each h at WWV, and 2 min.s before each h at WWVH. They are resumed on the h at WWV and WWVH and at 5 min.s intervals at both stations except for silent periods mentioned above. Universal time is announced in International Morse Code each 5 min.s from both stations.

ANN.: "National Bureau of Standards, WWV., when the tone returns Eastern Standard Time is... AM or PM".

V. by QSL-card or letter – **PUB.:** Prgr. sched on request.

STANDARD FREQUENCY BROADCAST.

WWVL on 20 kc continuous. The call sign WWVL is given in International Morse Code each hour and each 20 min. thereafter. Transmission continuous – WWVB on 60 kc continuous. The call sign WWVB is given in International Morse Code each h and each 20 min. thereafter. New facilities for WWVB and WWVL under construction near Fort Collins, Colorado, will be in operation early in 1963 with high power.

NATIONAL PHYSICAL LABORATORY (Go.)

ADDR.: Teddington, Middlesex, Gt. Britain.

MFS Standard Frequency Service:

kc	m	kW		kc	m	kW	
2500	120	0.5	continuous*	10000	30	0.5	continuous*
60	5000	10	14.29–15.30	5000	60	0.5	continuous*

*exc. for break in transm. from 15–20 minutes past each h.

ANN.: Call sign 3 times in slow Morse. "This is MFS, Rugby transmitting standard frequencies on 2500, 5000 and 10000 kc, the frequencies being maintained constant within 5 parts in 10^9 by reference to an atomic standard". – V. by letter.

ROYAL GREENWICH OBSERVATORY

ADDR.: Time Dept. Herstmonceux Castle, Hailsham, Sussex, England.

The international time signals are radiated by GBR (16 kc) or reserve st. GBZ (19.6 kc) at 03.00, 09.00, 15.00 & 21.00 and on high frequencies at 09.00 and 21.00. The frequencies used are selected according to current ionospheric predictions. Frequencies available: GIC24 4025 kc, GIC26 6985 kc, GIC27 7397.5 kc, GIC29 9350 kc, GPB30B 10331.5 kc, GPB30 10332.5 kc. GKU5 12790 kc, GIC33 13555 kc, GIC37 17685 kc, GIA39 19640 kc.

TIME SIGNAL FROM DOMINION OBSERVATORY.

ADDR.: Dominion Observatory, Dept. of Mines and Technical Surveys, Carling Av., Ottawa, Ontario – **Te.:** Central 12-8211 – **L.P.:** Dir. Adm.: Dr. C. S. Beals. Dir. Tec.: M. M. Thomson.

Stations: CHU 3330 kc 90.09 m 0.75 kW – 7335 kc 40.90 m 3 kW – 14670 kc 20.45 m 3 kW (Systems TMC, Collins). – **Time Signals** continuous, in voice and second pulses.

ANN.: Hours and minutes announced during the last 10 seconds of each minute: "CHU Dominion Observatory, Canada, Eastern Standard Time". – V. by QSL-card. – Rep. not wanted. – **PUB.:** Prgr. sched. free on request.

STATION JJY

ADDR.: Radio Research Laboratories, Koganei, Tokyo, Japan. **Te.:** (0423)-8-1661 aerial non-directional – Call JJY – All st's 2 kW.

2500 kc 06.59–22.59 5000 kc 24 h daily
10000 kc 24 h daily 15000 kc 24 h daily

All standard frequencies are interrupted at 29–39 minute past each h. No audio modulation on 15 Mc – V. by QSL-card. Send rep's to Standard Frequency Section.

HBN NEUCHATEL OBSERVATORY

ADDR.: Neuchatel, Switzerland – **Cable:** Observatoire – **Te.:** (038)-5-1238 – **L.P.:** Dir.: J. Bonanomi, W. Schuler – On 5000 kc all day long:

Prgr. of transmission: continuous tr. interrupted every 5 min. for 5 min. according to the following schema: 00 m 00 s – 04 m 50 s silence, 04 m 50 s – 05 m 00 s HBN (A_2), 05 m 00 s – 10 m 00 s carrier transmission with seconds pulses, 10 m 00 s – 14 m 50 s silence, etc.

Within the hour, the tr. is the following:

Minutes 0–5 silence, 5–10 carrier and seconds pulses, 10–15 silence, 15–20 carrier and seconds pulses, 20–25 silence, 25–30 carrier and seconds pulses, 30–35 silence, 35–40 carrier and seconds, 40–45 silence, 45–50 carrier and seconds, 50–60 silence.

STATION LOL

ADDR.: Observatorio Naval de la Secretaria de Marina Costanera Sud, Buenos Aires – **L.P.:** Dir. Gen.: J. Marpegán.

Standard Freq. and Signals: LOL:

5000 kc 2 kW 10000 kc 2 kW 15000 kc 2 kW

D. 11.00–12.00, 14.00–15.00, 17.00–18.00, 20.00–21.00, 23.00–24.00.

Schedule: 4 min. dash (1000 or 440 c/s alternately) beginning at 00.00, 00.05, 00.10 etc. Then 3 × LOL in morse followed by ann. Time signal transmission at min. 55–59 in each h.

STANDARD FREQUENCY STATION OMA

ADDR.: Budecska 6, Praha 2 Vinohrady, Czechoslovakia – **Te.:** 253017. Dir.: B. Šternberk.

OMA 50 kc 5 kW: 24 h – OMA 2500 kc 1 kW: 24 h – OLB5 3170 kc 8 kW D. 17.00–05.00 on all frequencies. OLD2 18985 kc 8 kW. Direction to Far East.

ANN.: In morse-code – V. by letter. Rep. wanted to OMA standard frequency st.

NATIONAL RESEARCH CENTRE OF TELECOMMUNICATIONS

ADDR.: Centre National d'Etudes des Télécommunications, Laboratoire de Bagneux, 196, rue de Paris, Bagneux (Seine), France.

FFH: 2500 kc 0.25 kW: Tues & Fri 08.30–16.30.

REP. OBSERVATORY-SOUTH AFRICA (Go.)

ADDR.: Republic Observatory, Johannesburg. Tel. 43–2026. **Cable:** Astronomer – **L.P.:** Dr. W. S. Finsen.

Stations: Call ZUO. Olifantsfontein 5000 kc 4 kW – Johannesburg 10000 kc o.25 kW – Johannesburg 100 Mc 0.050 kW Directional. 24 h per day, exc. for interruptions 15 to 25 min. past each h.

Time Signals: Continuous second pulses, consisting of 5 cycles of 1000 c/s tone. The minute pulse is prolonged to about 1/2 second –

ANN.: In morse code every 15 min.s (just before each quarter hour: ZUO, ZUO, ZUO followed by the Universal time of the next minute – V. by letter will be answered if they are genuine reports – **PUB.:** Monthly bulletin of Time and Frequency correction.

RWM, MOSCOW, USSR

ADDR.: Ministere des Comm. postales et electriques, Moscow.

STATIONS: All 20 kW: 5000 kc 05.00–08.00, 17.00–06.00 – 10000 kc 13.00–16.00 – 15000 kc 01.00–04.00, 08.30–13.06.

ATA, NEW DELHI, INDIA

ADDR.: National Physical Laboratory, New Delhi.

STATION: 10000 kc 2 kW. Mo-Fri 05.30–10.30.

BPV, PEKING, CHINA

ADDR.: BPV, Peking.

STATIONS: 5000 – 10000 – 15000 kc 24 hours daily.

IAM, ROME, ITALY

ADDR.: Instituto Superiore. Ministero P. T., Rome

STATION: 5000 kc 1 kW – All days exc. Sun 07.30–08.30.

IBF, TURIN, ITALY

ADDR.: Instituto Electrotecnico, Nazionale, Corso Massimo d'Azeglio, Turin.

STATION: 5000 kc 0.3 kW. W.: 07.00–07.30, 11.00–11.30.

ZLFS, LOWER HUTT, NEW ZEALAND

ADDR.: Dominion Physical Laboratory, Lower Hutt, Wellington C 1.

STATION: 2500 kc 0.3 kW: CW only – Tuesdays 01.00–04.00.

DCF77, MAINFLINGEN, GERMANY

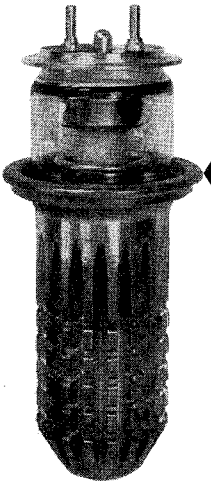
ADDR.: Physikalisch-Technische Bundesanstalt, Braunschweig, Fed. Republic of Germany.

STATION: 77.5 kc 12 kW. Daily transmission extends essentially from 07.45–12.45 and 19.45–20.45

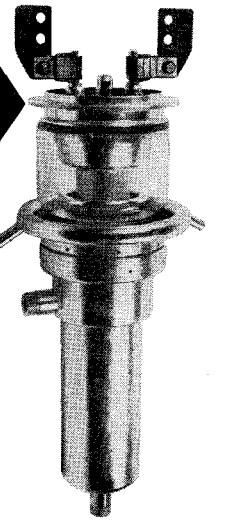
ELECTRON TUBES

For broadcasting transmitters
telecommunications
industrial purposes

Complete range of:



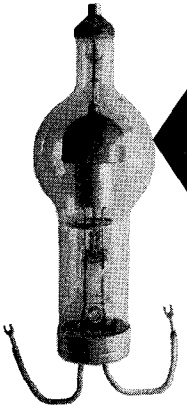
Water-cooled transmitting tubes
up to 145 kW output power



Vapour-cooled transmitting tubes
up to 145 kW output power

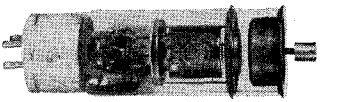
Air-cooled transmitting tubes
up to 145 kW output power

Radiation-cooled transmitting
tubes up to 6.4 kW output power



High-voltage rectifier tubes
for up to 24 kV/10 A

High-voltage and industrial
thyratrons up to 20 kV/50 A



Write now for full details of our tubes or for assistance in your tube problems

Representatives in most countries

DX-PROGRAMMES

All prgr's in English exc. where indicated.
AUSTRALIA: "R. Australia": "Australian DX'ers calling". Sat 22.00, Sun 05.30, 07.15 (25/3–27/10), 09.00 (29/10–24/3), 16.00, Mo. 02.15.
BULGARIA: "R. Sofia": Fri 21.30. 1st Sun of the month in German prgr. at 20.00–20.55.
CZECHOSLOVAKIA: "R. Praha": 1st Mo 19.00–19.30 "Around the World".
DENMARK: "Voice of Denmark": Tues 19.20, 20.35, Wed 02.20, 03.50, Thurs 09.50, 15.20.
FINLAND: "Finnish Broadcasting Co.": DX-Prgr. 1st and 3rd Fri of the month 16.00, 20.30 (Sept.-May). 1st & 3rd Sat of the month 11.30 (May-Sept.).
ECUADOR: HCJB: "Dx Party Line" 1st Tues 02.00 for No. Am.
GERMANY: "Deutsche Welle": 2nd Mo/Tues of the month 08.00, 11.00, 14.00, 17.15, 18.30, 20.30, 23.45, 01.15, 03.00, 04.15 – **"R. Berlin International"**: 1st Mo of the month at 17.00 (Swedish).
GR. BRITAIN: B.B.C.: "Shortwave listeners corner". Wed 00.30, 12.15. Thurs 15.45. Sun 06.45 (Pacific Service).
HAITI: Radio 4 VEH: "DX-Corner" Sat 03.00–03.30.
HOLLAND: "R. Nederland": "DX Juke Box" Thurs 07.12, 14.12, 19.42, 21.42, Fri 01.42.
HUNGARY: "R. Budapest": "Calling Radio Amateurs". Tues 20.00– for Europe, Wed 00.00 for No. Am.
JAPAN: "R. Japan": "DX-News" (in Listeners' Corner) Every 4th Sat/Sun at 15.05, 15.50, 18.15, 19.10, 00.05, 03.45, 06.00, 08.20, 10.10, 13.15 – **"Nihon Shortwave Broadcasting Co."** "DX-News" Sun 09.25–09.40, Tues, Fri 07.15 (Japanese only).
NEW ZEALAND: "R. New Zealand": "This Radio Age" 1st Wed 06.40, 10.30+following Sun 00.40.
NIGERIA: "R. Nigeria" (NBC): Mo 18.30.
PHILIPPINES: FEBC: "Shortwave mailbag". Mo 07.45, 15.00.
POLAND: "Polskie Radio": 2nd Fri 18.30 and every following Mo 21.30, Thurs 17.30 in Swedish.
RUMANIA: "R. Bucharest": 2nd and 4th Fri of the month 19.00, 22.30.
SWEDEN: "R. Sweden": "Sweden calling DX'ers". Mo at 12.30, 14.00, 14.45, 16.15, 17.45, 19.45, 20.30, 23.30, Tues 01.45, 03.15, as last part of English half hour. Every Wed in the German broadcast. Also in Spanish (once weekly) and Portuguese (Wed).
SWITZERLAND: "Swiss Shortwave Service": "DX Corner". Every Fri/Sat (in all English transmissions): 07.30, 09.30, 13.15, 15.15, 17.15, 19.15, 02.00, 04.45.
USA: "W.R.U.L.": Sat 18.30 – **"V.O.A."**: "Radio Amateurs' Notebook". Sun 07.30 (for Europe), 08.15 (for Austr. & N. Z.), 08.45 (for Asia), Sun 22.30 (for Europe), Mo 03.30 (for So. Am.).
U.S.S.R.: "R. Moscow": "DX Club" Mo 00.15 for No. Am.

ESPERANTO

AUSTRIA: Österreichischer Rundfunk: Tues 16.50 (2nd Prgr.).
BULGARIA: R. Sofia: Sun 19.00, 23.30.
FRANCE: R. diff. Télévision Française: Thurs 08.37 (Prgr. National-France III).
HOLLAND: First Mo of the month 22.40 (Hilversum I or II): Every Fri 22.00 (Hilversum I or II).
ITALY: R. Roma: Tues, Wed, Fri 17.55.
POLAND: Polskie Radio: D 15.30.
SWITZERLAND: Swiss Short Wave Service: Mo, Wed 12.20; Thurs, Sat 21.15.

RAYTHEON MICROWAVE RELAY SYSTEMS

Raytheon's complete line of wideband microwave relay equipment provides point-to-point FM transmission of high quality, black and white or color television signals and program audio, wideband data or message circuits. Designed for power outputs of 0.1 watt to 1 watt, in the frequency bands of 5925 Mc to 7450 Mc and 10,700 Mc to 12,700 Mc, Raytheon units offer maximum reliability under all field conditions.

Raytheon systems are also supplied in rack mounted styles and in compact luggage-type cases for portable applications. A full line of accessories and auxiliary equipment is available.

Write for FREE Raytheon Microwave System Planning Kit

Includes all technical data—together with profile and graph paper and special slide rule—for preparing microwave path surveys and site selection; describes transmission objectives, signal-to-noise factors; provides antenna system calculators, tables for rapid calculation of single-link and multi-hop performance. The Raytheon Microwave System Planning Kit is available, by request on your letter head. Please include your title and function. For your Kit and technical data on Raytheon's complete line of microwave relay systems, write: Raytheon Company, International Sales and Services, Dept. A, Lexington, Massachusetts, U.S.A.

Set Manufacturers:

RAYTHEON TV SET ASSEMBLIES FOR PORTABLES AND CONSOLES

Raytheon offers complete TV Kits, or components and subassemblies in any combination you require for use with locally obtained material to produce 19" and 23" receivers. Features include printed boards, minimum assembly and testing requirements and full engineering assistance. For complete details write: Raytheon Company, International Sales and Services, Dept. A Lexington, Massachusetts, U.S.A.

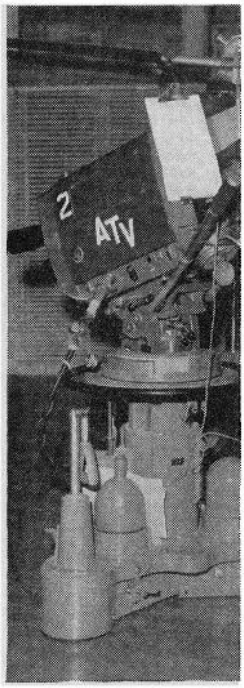
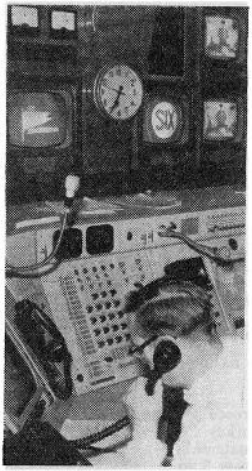
COMPREHENSIVE TELEVISION PRODUCTION AND TRANSMISSION EQUIPMENT

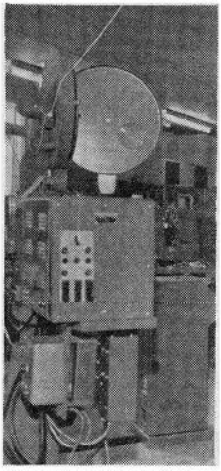
STUDIO CAMERAS



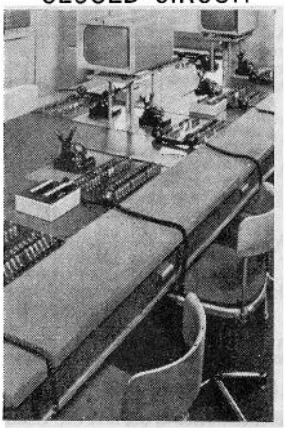
CONTROL



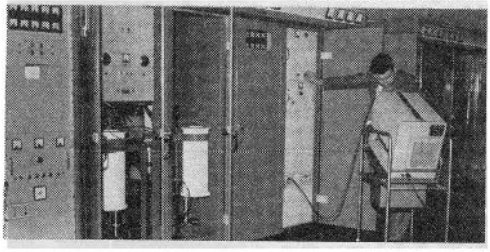
TELECINE

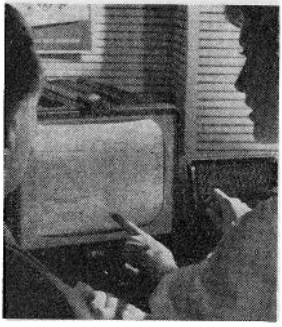


CLOSED CIRCUIT



TRANSMISSION





With a distinguished history dating from 1930, when the nucleus of the television equipment development organisation was established, Pye are now one of the largest manufacturers of production and transmission equipment, covering every aspect of television station activities. Within the video field a comprehensive range includes studio and field cameras and ancilliary gear, waveform and synchronising generators, mixing, monitoring and distribution equipment, telecine, montage and special effects devices and complete control systems. For outside broadcast purposes Pye provide a variety of mobile control rooms, and are the principal suppliers of mobile equipment to British and overseas services. In the transmission field, too, they have equipped many of the world's leading networks, supplying additionally all necessary test gear and radiating equipment. A large scale station planning service has been operating very successfully for many years. Finally, in the field of closed-circuit television for industrial, commercial and official users, in which they were pioneers, Pye have been responsible for many of the world's most important installations.

PYE TVT LTD. are able to pass on to users of their equipment the benefits of their participation in the Pye Group of Companies whose overall resources in scientific knowledge, technology, engineering experience and specialisation bring to the optical, electronic and mechanical components of their equipment the highest standards of quality.

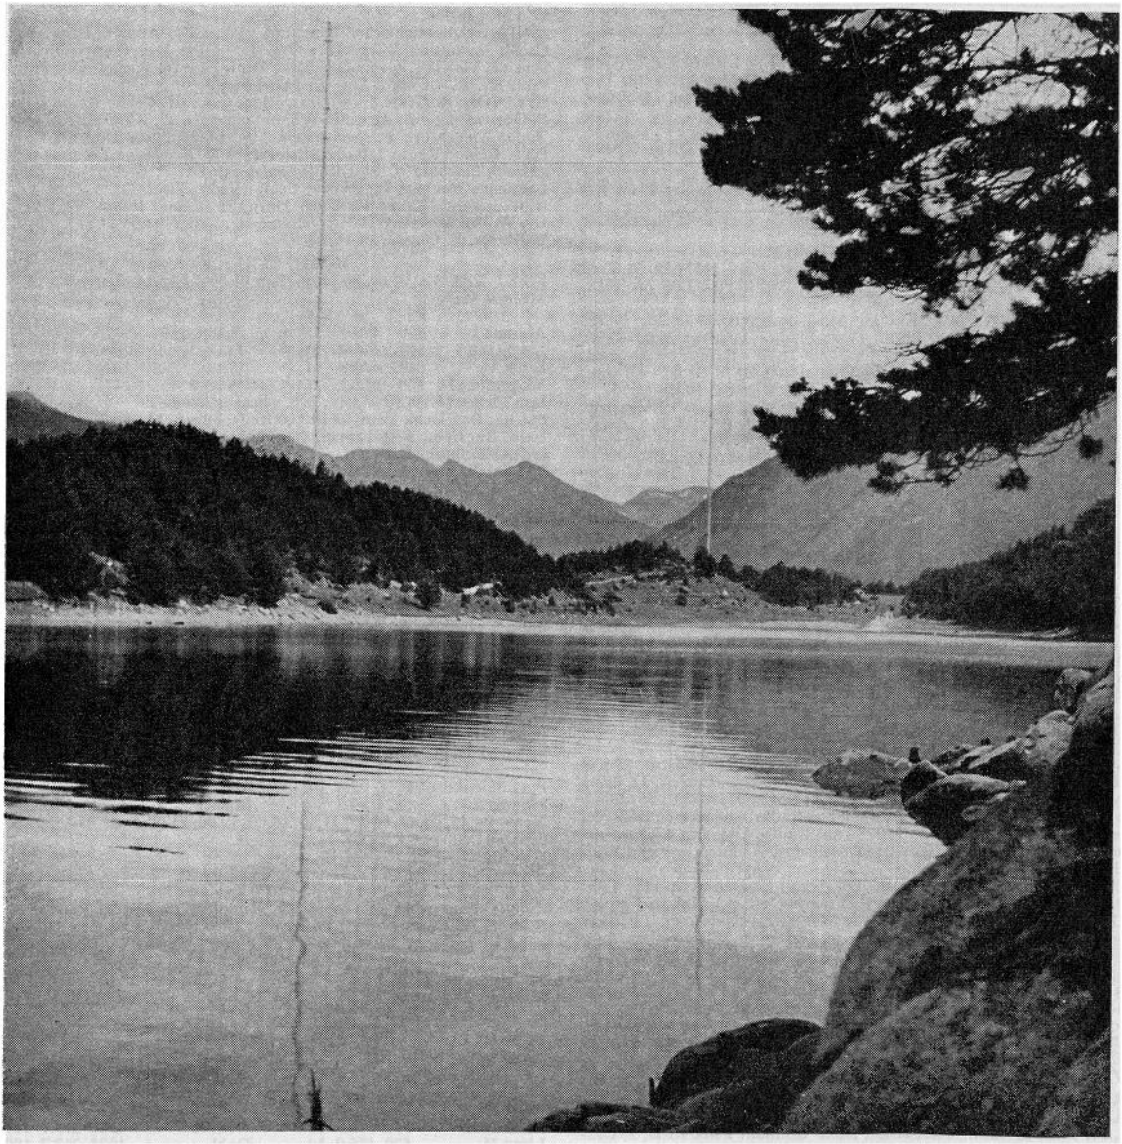
AQUI RADIO ANDORRA!



(PHOTO PEIG, ANDORRE).

AQUI RADIO-ANDORRA, c'est l'indicatif universellement connu d'une des stations les plus populaires d'Europe. RADIO-ANDORRE qui émet quotidiennement en Français, en Espagñol, en Allemand, en Anglais, etc... a installé ses pylônes et ses antennes "les plus hautes d'Europe" au bord du lac d'Engolasters, à 2.000 mètres d'altitude, dans le cadre d'un des sites les plus pittoresques de la Principauté d'Andorre.

TELEVISION IN FINLAND

The first TV test transmission by wire was made in Finland in the year of 1950.

Finland's Television inaugurated regular programmes on Jan. 1st, 1958. This happened after a period of technical trials.

In the course of one year, 1958, Finland's Television put into operation four new TV transmitters to cover one third of the population. At the beginning of 1963 the number of transmitters increased to 23, and 85 % of the population is now reached by TV.

The number of TV viewers is rapidly increasing. On Jan. 1st, 1959 they were 7.757, two years later the figure amounted to 92.000, at the beginning of 1962 there were 190.000 licences, and at the end of September 1962, 285.000.

Finland's Television is on the air 6-7 hours a day.

A TV studio centre is under construction. As a first part of it a large studio, capacious enough for TV play production, was completed in 1961. Another large studio is under construction.

For live broadcasts in different parts of the country there are two outside broadcasting units in use.

LISTEN TO FINLAND

FINLANDIA MIXTURE tells you what Finland is apart from the country of the thousands lakes, the "sauna", and the midnight sun. Every Monday at 16.00–16.30 G.M.T.

AROUND THE WORLD gives you the latest DX-news.
The first and third Friday of the month at 16.00–16.30 G.M.T.

MUSICAL MAILBAG, listeners' request programme.
All other Fridays at 16.00–16.30 G.M.T.

15190 kc/s – 19,75 m. 11805 kc/s – 25.41 m.
9555 kc/s – 31.40 m.

telecommunication journal

In the increasingly international age in which we live, it is more important than ever that everyone connected with radio should be in touch with authoritative world opinion on radio matters.

The Telecommunication Journal, the official organ of the International Telecommunication Union (ITU), serves just this purpose. Since 1869 (when it first appeared as the "Journal Télégraphique") it has faithfully covered all aspects of telecommunications which come within the purview of the world organization (now a UN specialized agency) set up in 1865 to regulate them.

The Journal has recently been completely revised and modernized.

It contains

- a news section covering the activities of the ITU, of its Member Administrations and of private operating companies and highlighting technical advances in radio throughout the world –
- articles by world experts, with a heavy emphasis recently on the latest developments in space communications-
- a monthly "Telepersonality" featuring an outstanding personality from the telecommunication world –
- a comprehensive list of articles of telecommunication interest appearing in the scientific press throughout the world –
- official ITU information, including lists of forthcoming ITU Conferences and other international telecommunication meetings –
- monthly sunspot predictions.

It is published monthly by the ITU in separate English, French and Spanish editions.

It costs 2 Swiss francs a copy. The annual subscription is 20 francs for one language edition, 30 francs for two and 40 francs for three.

For further information, write to: Telecommunication Journal, ITU, Place des Nations, Geneva, Switzerland.

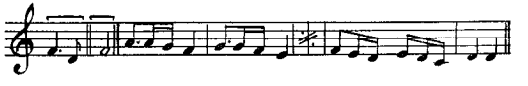
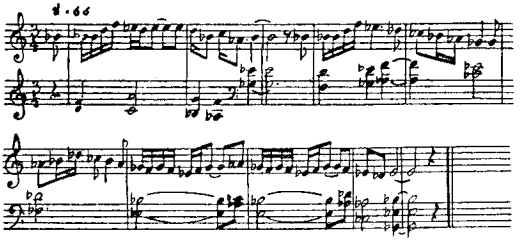
ANN.: "This is Radio Norway with its shortwave service for Norwegians abroad".
INT.-SIG.: Every s.w. transmission is introduced by the following theme, which originates from an ancient folk tune from Hallingdal.



Five minutes previous to every s.w. tr. the following signal is sent:



Message to our English-speaking audience: In our daily prgrs. for Norwegians abroad we will usually have a section of Norwegian music or music presented by Norwegian artists. This musical section, which lasts 15 to 20 minutes, is introduced in **English** as well as in **Norwegian.** On Wed and Sat you can listen to our **"Letter Box Programme",** in which we play our listener's **request records.** We often receive letters from listeners in Norway with request to play a record with a greeting to one of their relatives abroad, but we regret to be unable to comply with these requests. Every Sunday we have an additional prgr. in English, **"Norway this week",** in which we try to present Norway in different ways through music and feature prgrs. We are very grateful for comments on our transmissions. Reports are answered by QSL-card. Return postage is not necessary. Our postal address is: **RADIO NORWAY,** Oslo, Norway.
PUB.: Programbladet (weekly). Prgr.schedule free on request.

NORWEGIAN BROADCASTING CORP.

Oslo, Norway

Every two months first-hand information on the world of broadcasting is offered to you in the

E. B. U. REVIEW

published by the European Broadcasting Union

Part A – Technical – will keep you up-to-date regarding the long-and medium-wave situation in the European Broadcasting Area and the latest developments in the television and sound broadcasting networks on metric waves,

including such questions as

wave propagation and frequency assignments in all of the broadcasting bands,

the installation and operation of transmitting stations and studio centres, of recording systems and outside-broadcast facilities, both for sound and television,

Eurovision, etc.

Part B – General and Legal – will inform you of administrative, programme and legal developments in radio and television throughout the world

such as

the activities of international organisations concerned with broadcasting in all non-technical fields,

the progress of radio and television organisations in most countries from the point of view of administration, finance and programmes,

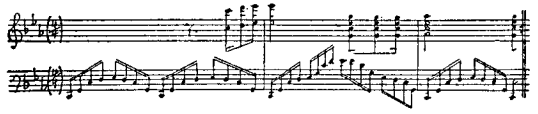
analyses of new Copyright Acts and all legislation and jurisprudence touching upon broadcasting.

ANNUAL SUBSCRIPTION:

Part A (six numbers): price 150 Belgian francs. Publishers: E. B. U. Technical Centre 32, Avenue Albert Lancaster, Bruxelles (Belgium).

Part B (six numbers): price 15 Swiss francs. Publishers: E. B. U. Administrative Office, 1, rue de Varembé Geneva (Switzerland).

A combined subscription to Parts A and B (twelve numbers) may be ordered either from Brussels or from Geneva (price 300 Belgian francs or 27 Swiss francs).



V. by QSL-card and letter. Re. to Polskie Radio. Al Niepodleglosci 77/85, Warsaw – PUB.: "Radio i Telewizja" (weekly).

The Broadcasting House in Moscow

HERE IS MOSCOW!

Moscow radio broadcasts to foreign listeners on short and medium waves in 41 foreign languages and 9 of the languages spoken in the Soviet Union.

In its broadcasts Moscow radio talks about life in the Soviet Union and about the most important international events.

The broadcasts from Moscow radio comprise news, comment, conversations, interviews, surveys, and special programmes for women, children and young people, scientific and technical, sporting and literary programmes, plus music.

To the microphone of Moscow radio come statesmen of the Soviet Union, prominent Soviet Russian scientists and cultural personalities, as well as foreign guests – political and public figures, representatives of business life, scientists, artists, workers, peasants and the clergy.

Moscow radio answers by radio and post letters from its listeners, broadcasts request concerts, arranges various competitions where winners receive prizes.

LISTEN TO THE BROADCASTS FROM MOSCOW RADIO

Hours of transmission and wave lengths are given in this handbook.

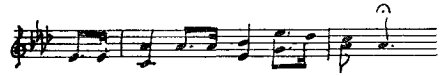
RELAY STATIONS:
For frequencies of the relay stations, refer to the individual countries; Germany, Greece, Dodecanese Islands, Great Britain, Tangier, Ceylon, Hawaii, Ryukyu Islands, Philippines, Liberia.

ANNOUNCEMENT:
Each program ends with these words spoken in English: "This program has come to you from the United States of America". The station identification is then announced in English.

INTERVAL SIGNAL:
Choir of brass playing a 10 note version of "Columbia, the Gem of the Ocean". This musical symbol is played at the beginning of a transmission, during station breaks, and at the conclusion of a transmission. At the beginning of a transmission the sign on announcements is followed by 3 minutes of musical symbol made up of alternate 5 seconds music and 5 seconds silence.



VERIFICATION by QSL-card. No return postage required.

F.PL.: The Voice of America is completing two new stations to be on the air in 1963. They are located at Greenville, North Carolina where there will be six 500 kW, six 250 kW and six 50 kW shortwave transmitters to improve VOA's signal to Europe, Africa, the Middle East and Latin America; and the other at Monrovia, Liberia to consist of six 250 kW and two 50 kW shortwave transmitters. The primary purpose of the latter station is to reach all of Africa and to give supplemental coverage to parts of Central Europe and the Middle East. Until it is finished, the VOA will be broadcasting via three 50 kW transportable shortwave transmitters temporarily set up on the Monrovia site. Other planned construction includes increasing the power of the station in the United Kingdom to six 250 kW shortwave transmitters and erecting a transmitting station on the Island of Rhodes to replace the floating relay station, the "Courier". This last station will have one 150 kW medium wave transmitter and two 50 kW shortwave transmitters.

ARMED FORCES RADIO and TELEVISION SERVICE

ADDR.: Directorate of Armed Forces Information and Education, Washington 23, D.C. – **FI.:** By State (Dept. of Defense).
This office exercises over-all policy control of the Armed Forces Radio and Television Service. The mission of AFRTS is to keep U.S. Service men and women stationed outside the States the best informed service personnel in the world on current events. **All broadcasts are in English.** News, sports and other timely matter is beamed overseas directly by ten powerful tr. on the U.S. Atlantic and Pacific coasts. These s.w. broadcasts serve the overseas radio stations, which rel. them locally. Prgrs. other than news and locally produced prgrs. are derived directly from the U.S. Commercial radio and tv. networks. N. is compiled from the wires of A.P. and U.P.I. and include voice actuality and "from the scene" report segments. Regular shortwave prgr's are presented daily from both Los Angeles and New York City, over the tr's of the V.O.A. The operational headquarters of AFRTS, at Los Angeles, ships undated radio and tv. prgrs. on transcription and film, respectively, to overseas stations, and controls the Pacific Shortwave Service. Officer in Charge: Lt. Colonel Lother B. Sibert, USA.
PACIFIC SERVICE (from Los Angeles).
ADDR.: AFRTS Shortwave 1016 No. McCadden Place, Los Angeles 38, Calif. **Te.:** Hollywood 23301 – **L.P.:** Officer in charge: Lt. Colonel L. B. Sibert. (All communications must be received through officer in charge).
D. PRGR.: 23.30–16.30.

PRIVATE STATIONS

FEDERAL COMMUNICATIONS COMMISSION. An independent Federal agency composed of seven Commissioners appointed by the President, by and with the advice and consent of the Senate. One of its major activities is the general regulation of broadcasting – now visual as well as aural. This regulation, largely technical in nature, may be divided into two phases: 1) The allocation of spectrum space to the different types of broadcast services. 2) Considerat ons to build and operate individual stations.

Call letters. – International agreement provides for the national identification of the radio station by the first letter or first two letters of its assigned call signal, and for this purpose apportions the alphabet among different nations. United States stations use the initial letters K, N, and W, exclusively, and part of the A series. Broadcast stations are assigned call letters beginning with K or W. Generally speaking, those beginning with K are assigned to stations west of the Mississippi River and in the territories and possessions, while W is assigned to broadcast stations east of the Mississippi.

Number of Broadcasts Stations in the USA as of July 30th, 1962:

	Authorized	Licensed	Operating
A.M. Comm.	3892	3590	52
F.M. Comm.	1198	958	1027
F.M. Educational	210	192	202
TV Comm.	657	505	562
TV Educational	81	43	58

Also, 1046 TV-repeater and 1496 TV translator stations are authorized to pick up and rebroadcast programs of regular TV-stations.

EDUCATIONAL STATIONS (non.-comm.)

ADDR.: Office of Education, Washington 25, D.C. – **L.P.:** Chief Radio-Television: John F. White.

Educational and Television Center: Coliseum Bldg., Columbus Circle, New York City, N.Y.

NATIONAL ASSOCIATION OF EDUCATIONAL BROADCASTERS (NAEB).

FI.: By membership fees. Also some support from outside sources for special research projects. The national independent professional association, which since 1925 has represented the interests and needs of educational television and radio broadcasters, represents appr. 75% of the educational stations and production centers of the United States (appr. 90% exc. those identified as religious st.).

ADDR.: Headquarters: 1346 Connecticut Avenue, N.W., Washington 6, D.C. **Te.:** 667-6000. Publications and Network Offices: 119 Gregory Hall, Urbana, Illinois, **Te.:** 338-0580.

L.P.: Pres. William G. Harley, Vice-Pres.: Harold E. Hill. Stations: 185 educational institutions and organizations owning and operating a total of 244 educational radio and TV stations.

Activities and Functions: The NAEB is the Association of American institutions operating educational, cultural and public Sce.'s, radio and TV st.'s and production centers. Publish a monthly Newsletter, a semi-monthly Washington Report, and a bi-monthly Journal. The NAEB also operates a radio network which duplicates via tape and distributes to members st.'s ten hours of programming per week. At present there are some 118 st.'s in this network. Exchanges of prgr.'s with other nations are welcomed. It also actively cooperates with various international organizations (European Broadcasting Union, UNESCO etc.), and the national systems of various other countries. According to federal communications commission regulations, non-comm. educational FM st.'s have no restrictions on transmission time.

COMMERCIAL STATIONS

NATIONAL ASSOCIATION OF BROADCASTERS

ADDR.: 1771 N. Street N. W. Washington 6, D.C. – **Te.:** Decatur 2–9300.

Purpose: The purpose of the Association is to foster and promote the development of the arts of aural and visual broadc. in all its forms; to protect its members in every lawful and proper manner from injustices; to do all things necessary and proper to encourage customs and practices which will strengthen and maintain the broadc. industry to the end that it may best serve the public.

L.P.: Chairman: C. R. McCollough. Pres.: LeRoy Collins Sec-Treasurer: E. E. Revercomb.

Members as of June 1 1962: AM Radio 1828. – FM Radio 648 .– TV stations 388. – Radio Networks 4. – Television Networks 3.

M. W. Stations operating with a power of 10 kW and above.

The time each station is authorized to operate is indicated in the list. Each station is required to operate at least two-thirds of the hours it is authorized to operate between 6:00 AM and 6:00 PM, and two-thirds of hours it is authorized to operate between 6:00 PM and midnight. If authorized to operate unlimited time, it may operate for the entire 24 h.

Abbreviations: D: Daytime operation. LS = Local Sunset. N: Night. L + Limited Time. + = CP granted for increase of power. CP = Construction permit. a) 24 h. Al = Alabama. Ala = Alaska. Ariz = Arizona. Ark = Arkansas. Cal = California. Colo = Colorado. D = Dakota. Fla = Florida. Ga = Georgia. Id = Idaho. Ill = Illinois. Ind = Indiana. Ia = Iowa. Kan = Kansas. Ky = Kentucky. TECHNICAL HANDBOOKS

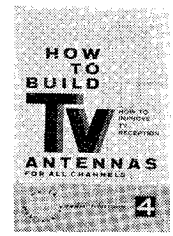
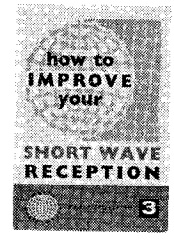
on Radio and TV

TV and FM Antennas



Describes how to build TV and FM antennas for all channels. By F. Rydström, O. Engelstoft and A. Fialla.
Explains **all problems** connected with TV and FM antennas and TV reception and with "how-to-build" articles dealing with **TV and FM antennas for all channels.**
Price: Da. Kr. 12.75, £ 0/13/6, $ 2.-, DM 9.00, Sw. Kr. 9.75 plus postage: Da. Kr. 1.20, £ 0/1/3, $ 0.20, DM 0.75, Sw. Kr. 0.50. **Prices incl. postage:** Da. Kr. 13.95, £ 0/14/9, $ 2.20, DM 9.75, Sw. Kr. 10.25. By airmail extra cost: Da. Kr. 7.00, £ 0/7/5, $ 1.00.

How to improve your Short Wave Reception



A practical handbook for short wave enthusiasts who wish to know all about short wave reception, the technical aids and means of improving it, and who wish themselves to build short wave receivers or means to improve short wave reception such as an effective short wave antenna, preselector etc.

Prices: Da. Kr. 12.50, £ 0/13/6, $ 2.00, DM 9.00, Sw. Kr. 9.75 plus postage: As for: How to build TV-antennas. **Prices incl. postage:** Da. Kr. 13.70, £ 0/14/9, $ 2.20, DM 9.75, Sw. Kr. 10.25. By airmail extra cost: Da. Kr. 7.00, £ 0/7/5, $ 1.00.

Transistors – theory and practice

An up to date and "how to build" handbook, which in an easy understandable manner and in a new way explains the theory and the practical use of transistors.

Prices: Da. Kr. 9.75, £ 0/9/6, $ 1.50, DM 6.00, Sw. Kr. 7.50 plus postage: Da. Kr. 0.60, £ 0/0/8, $ 0.10, DM 0.50, Sw. Kr. 0.50. **Prices incl. postage:** Da. Kr. 10.35, £ 0/10/2, $ 1.60, DM 6.50, Sw. Kr. 8.00. By airmail extra cost: Da. Kr. 7.00, £ 0/7/5, $ 1.00.

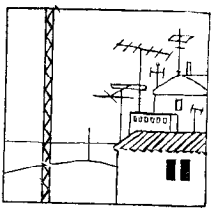
WORLD TELEVISION



The principal CCIR* television systems:
Definition refers to the standard which is normally stated in terms of the number of lines which make up the image. Reference in the following surveys is made throughout merely to 405 lines, 525 lines, 625 lines, 625 lines (OIRT**) and 819 lines respectively.

	— CCIR/Systems* —			
Number of lines per picture	405	525	625	819
Video bandwidth (Mc/s)	3	4	5	10.4
Channelwidth (Mc)	5	6	7	14
Sound carrier relative to vision carrier	÷3.5	+4.5	+5.5	÷11.15
(Sound carrier relative to edge of channel)	+0.25	÷0.25	÷0.25	+0.10
Interlace	2/1	2/1	2/1	2/1
Line frequency (c/s)	10.125	15.750	15.625	20.475
Field frequency (c/s)	50	60	50	50
Picture frequency (c/s)	25	30	25	25
Sense of vision modulation	Positive	Negative	Negative	Positive
Level of black as percentage of peak carrier	30	75	75	25
Sound modulation	AM	FM	FM	AM

* The International Radio Consultative Committee.
**The characteristics are the same as 625 lines exc. for a difference in bandwidth: video bandwidth 6 Mc, channelwidth 8 Mc, sound carrier relative to vision carrier +6.5 Mc.

The following pages give you the data for the different TV stations of the world. The channel is indicated by a letter followed by a figure. The letter indicates the technical data of the systems which are in use (A: American, B: British etc.) and the figure is the channel number.
The power for vision and sound are indicated by a fraction, the numerator indicating the number of kW (ERP) for vision and the denominator for sound, for example 6/1.5 means vision 6 kW ERP and sound 1.5 kW ERP.
Differences in Belgian TV from resp. CCIR 625 and French 819:

	CCIR 625	Belgian 625	French 819	Belgian 819
Video bandwidth (Mc)			10.4	5
Channelwidth (Mc)			14	7
Sound relative to vision			÷11.15	+5.5
Sound relative to edge of ch.			+0.10	÷0.25
Vision modulation	Negative	Positive		
Level of black as percentage of peak carrier	75	25		
Sound modulation	FM	AM		

United States of America. Number of lines: 525.

Television on VHF/UHF Europe (Band IV/V).
VHF/UHF television systems adopted by the European Broadcasting Conference Stockholm 1961 are 625-lines systems only. These can be grouped into 5 categories, here called Standards G to L:

Standard	Video Band-width (Mc/s)	Picture/ Sound Separation (Mc/s)	Vestigial Sideband (Mc/s)	Picture modulation	Sound modulation	Frequency of chromi-nance subcarrier (Mc/s)	Power ratio picture/ sound
G	5	5.5	0.75	Neg	FM	4.43	5:1
H	5	5.5	1.25	Neg	FM	4.43	5:1
I	5.5	6	1.25	Neg	FM	4.43	5:1
K	6	6.5	0.75*)	Neg	FM	4.43	5:1
L	6	6.5	1.25	Pos	AM	4.43	8:1

* Administrations proposing this Standard are studying the possibility of extending the vestigial sideband to 1.25 Mc.

UNITED STATES OF AMERICA

	Authorized	Licensed	Operating
TV commercial st's:	657	505	562
TV educational st's:	81	43	58

EDUCATIONAL TV-STATIONS: The 81 operating TV educational stations are mainly situated in the large cities and university centres. They are of three types: 1) Community stations supported by voluntary funds; 2) University stations supported by State and local budgets; 3) State-owned networks covering entire divisions of the country supported entirely by taxation. An interesting development for educational purpose is closed-circuit TV, limited to universities and to individual school-systems. A prgr. sce. known as the National Educational Television and Radio Center located at Coliseum Bldg., Columbus Circle, New York City, N.Y., supplies educational TV prgrs. to the present stations and in addition, distributes its prgr's to both closed circuit and film projectors which are in use in thousands of schools.

The Editor of the *World Radio Television Handbook* seeks information from all stations engaged in broadcasting and interested in international broadcasting and publishes the information as communicated to him by the stations. The Editor cannot be held responsible for the correctness of this information or for not publishing schedules and other particulars of stations which do not supply this information, or for changes in the times and wavelengths of programmes made after the current edition has gone to press.

SHORT WAVE STATIONS OF THE WORLD

Moscow frequencies are omitted from the list as they are changed very often. All the Moscow frequencies reported are shown in the USSR-text. –*Standard Frequency Station **Time Signal Station. Br.=Brazil, Cl.=Cultura, Col.=Colombia, Czecho.=Czechoslovakia, Ger.=Germany, Guat.=Guatemala, Hon.=Honduras, Isl.=Island, Venez.=Venezuela.

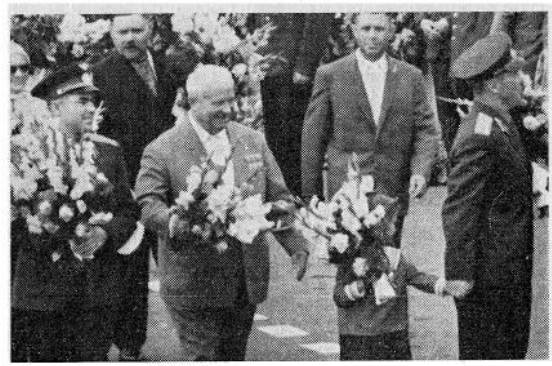
Addr.: The Technical University of Norway, Trondheim.

STATIONS: 1115 kc 269.1 m 0.5 kW – 1484 kc 202.2 m 0.5 kW – 7210 kc 41.61 m 0.5 kW – 9610 kc 31.22 m 0.5 kW – **FM:** 94.75 Mc 1 kW.

HOME SCE. in Norwegian: Every year approx. 3 weeks during September/October as follows: Mo-Fri 14.00–15.00 when on normal clock time, otherwise: Sun-Fri 22.00–23.00, Sat 22.30–23.30 (times approx). **Prgr's** consist of shows, mailbag prgr's, requests and various entertainment as well as commercials in Norwegian, French, German, Finnish. Occasionally prgr's in English. V. by QSL-card. Rp. desirable.

LAST MINUTE INFORMATION



One of the great events in 1962 was the double space trip of the two cosmonauts, Nikolajev and Popovitj. Their tremendous reception in Moscow was televised and broadcast to most of the world. N. S. Hrustjov is here seen on Vnukovo airfield between the two cosmonauts - Nikolajev on the extreme left, Popovitj on the right.

Copy, Brochure and Ratecard on request to our Representatives or to **World Radio Television Handbook**, Lindorffsalle 1, Hellerup, Denmark.

Facts that convince:

The sold circulation of the 1963 edition is conservatively estimated at 18000 copies, but it will reach at least 100.000 individuals interested in your products.

The only international handbook distributed to almost all broadcasting and television stations, manufacturers of electronic equipment, libraries, professionals, amateurs and listeners.

The only international handbook, which contains complete and exact information about broadcasting and television in all countries.

Highly appreciated and recommended by the United Nations, Unesco and all broadcasting and television organizations throughout the world.

Circulated to Technical Controllers of broadcasting and television stations, to leading users of equipment in the field of broadcasting and television and to manufacturers looking for a world market for their products.

Leading firms in electronics and leading broadcasting organizations have for years been steady advertisers for their products or their broadcasts and countries.

These facts give authority and weight to a salesmessage in the World Radio Television Handbook.

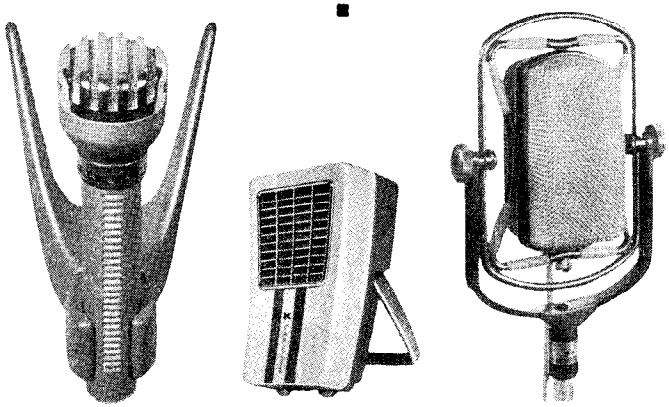
PRINTED IN DENMARK

Million-dollar Studio

or

Fifty-dollar Mike

?



D19B D11N D45B

★ A million dollars might buy you an acoustically-perfect recording studio, free of low-frequency reverberation.

★ Fifty dollars will buy an AKG dynamic cardioid microphone that does the same job, retains its directional selectivity clear down into the bass and makes even a »live« livingroom a recording studio.

Of all microphone makers, AKG of Vienna has the basic patents on dynamic mikes with full-range cardioid response — the characteristic that alone makes this possible. AKG's cardioids are cardioid where you need it most!

This is only one of the plus values in an AKG. They are all rugged . . . smooth in their translation of sound . . . built with care and oldworld craftsmanship.

From von Karajan to Joe Doakes, AKG is first choise for crips, full-bodied sound. From $ 485 to $ 27*), AKG dynamics are the cardioidest dynamic mikes you can buy today.
